Notes:

1. In cases where more than one author or Professional of Record have contributed to different parts of the document, they must indicate which sections they are authenticating.

2. Only Professionals of Record are required to stamp or seal documents; however if the author is not the Professional of Record, they are encouraged to also add their signature or stamp/seal if applicable.

Disclaimer

This report is rendered solely for the use of Blackwater Gold Ltd. (BW Gold) in connection with the Blackwater Gold Mine (the Mine), and no person may rely on it for any other purpose without Triton Environmental Consultants Ltd.'s (Triton) prior written approval. Should a third party use this report without Triton's approval, they may not rely upon it. Triton accepts no responsibility for loss or damages suffered by any third party as a result of decisions made or actions taken based on this report.

This report is based on facts and opinions contained within the referenced documents, including the results of any data collection programs carried out in relation to this report. We have attempted to identify and consider facts and documents relevant to the scope of work, accurate as of the time period during which we conducted this analysis. However, the results, our opinions, or recommendations may change if new information becomes available or if information we have relied on is altered.

We applied accepted professional practices and standards in developing and interpreting data. While we used accepted professional practices in interpreting data provided by BW Gold or third-party sources, we did not verify the accuracy of any such data.

This report must be considered as a whole; selecting only portions of this report may result in a misleading view of the results, our opinions, or recommendations.

1.0 Introduction

1.1 Project Overview

The Blackwater Gold Mine (the Mine) is a gold and silver open pit mine located in central British Columbia (BC), approximately 112 kilometres (km) southwest of Vanderhoof, 160 km southwest of Prince George, and 446 km northeast of Vancouver. The Mine is located within the traditional territories of the Lhoosk'uz Dené Nation, Ulkatcho First Nation, Skin Tyee Nation, and the Tsilhqot'in Nation. The Mine's access road and transmission line cross the traditional territories of the Nadleh Whut'en First Nation, Saik'uz First Nation, Stellat'en First Nation, Nazko First Nation, Nee Tahi Buhn Band, Cheslatta Carrier Nation, and the Yekooche First Nation (BC Environmental Assessment Office [BC EAO] 2019a). The Mine footprint, located in the headwaters of the Davidson Creek and Creek 661 watersheds, includes an approximate area of 4,400 hectares, which accommodates the Mine, mine waste, ore processing, and on-site infrastructure.

New Gold Inc. received a Federal Decision Statement (DS) on April 15, 2019, under the *Canadian Environmental Assessment Act, 2012* (Canadian Environmental Assessment [CEA] Agency 2019), and an Environmental Assessment Certificate (EAC) #M19-01 on June 21, 2019, under the British Columbia 2002 *Environmental Assessment Act* (BC EAO 2019b). In August 2020, Artemis Gold Inc. (Artemis) acquired the mineral tenures, assets, and right in the Blackwater Project, that were previously held by New Gold Inc. The EAC was transferred to Blackwater Gold Ltd. (BW Gold), a wholly owned subsidiary of Artemis, on August 7, 2020, under the 2018 *Environmental Assessment Act* (BC EAO 2020). BW Gold received *Environmental Management Act* (EMA) Permit PE-110602 on June 24, 2021, authorizing early construction works, and Permit PE-110652, authorizing discharge of effluent from the Mine to surface water and groundwater, on May 2, 2023. The Mine's construction phase was initiated in September 2022, with works continuing through 2025. Mining operations commenced on May 1, 2025, with the expected life of the Mine being 23 years.

1.2 Regulatory Requirements and Objectives

In accordance with regulatory approval requirements, long-term aquatic monitoring programs have been implemented for waterbodies in the Mine area to detect and measure changes to aquatic resources and to determine if these changes constitute mine-related effects. Condition 3.14 of the DS required BW Gold to develop a Fish and Fish Habitat Follow-Up Program (FUP) to be implemented during all phases of the Mine to verify the accuracy of the environmental assessment (EA) and to assess the efficacy of fish and fish habitat mitigation measures for Davidson Creek. The 'Follow-Up Programs for Condition 3.14 of the Blackwater Gold Decision Statement Issued under Section 54 of the *Canadian Environmental Assessment Act*' (Palmer Environmental Consultants Group Ltd. [Palmer] 2023) was developed to fulfill this condition.

The 'Aquatic Effects Monitoring Program (AEMP) Plan Version 4.0' (ERM & Triton 2025) was developed to address Permit PE-110652 Condition 4.6 and Condition 30 of the EAC #M19-01. The AEMP has been designed to provide information on the aquatic receiving environment and to detect potential Mine-related effects on the AEMP components (physical, chemical, biological).

1.3 Scope of Work

This report describes the methods and results of the 2025 Rainbow Trout (*Oncorhynchus mykiss*; RB) Spawner Survey field program, conducted by Triton Environmental Consultants Ltd. (Triton) from April to June 2025 to fulfill yearly monitoring requirements described in the FUP for Condition 3.14 and the AEMP Plan Version 4.0. Specifically, in relation to Condition 3.14, this field program pertained to sub-condition 3.14.2.3 – characteristics of spawner populations. Furthermore, this field program related to Section 4.8.4 of the AEMP Plan - Rainbow Trout Spring Spawning Survey. Rainbow Trout spawner surveys were conducted with a combination of physical fish capture surveys (using paired box traps and fish fences) and visual spawner surveys.

1.4 Measurement and Assessment Endpoints

Measurement and assessment endpoints are specified in the FUP for Condition 3.14 (Palmer 2023) and AEMP Plan Version 4.0 (ERM and Triton 2025). Endpoints relevant to the Rainbow Trout Spawner program are provided in Table 1-1, Table 1-2, and Table 1-3, for ease of reference. The measurement and assessment endpoints of the Rainbow Trout Spawner Survey program are similar between the FUP for Condition 3.14 and the AEMP Plan Version 4.0, and they generally include spawner and redd abundance, spawner and redd distribution, population structure, and fish size and condition.

Table 1-1. FUP for Condition 3.14 measurement and assessment endpoints for Rainbow Trout Spawner Surveys

Measurement Endpoint	*Assessment Endpoint*
Fish abundance	Total number of adult spawners returning to Davidson Creek Aging samples to characterize population
Fish distribution	Number of adult spawners captured at each Davidson Site
Fish size at 100% maturity	Length, weight, age at 100% maturity RB

Table 1-2. FUP for Condition 3.14 measurement and assessment endpoints Rainbow Trout Spawner Survey bank walks

Measurement Endpoint	*Assessment Endpoint*
Fish abundance	Number of adult spawners observed and their density at each survey site
Fish distribution	Relative number of adult spawners observed at each survey site
Redd abundance	Relative number of redds observed and their density in each survey site

Table 1-3. AEMP measurement and assessment endpoints Rainbow Trout Spawner Surveys

Measurement Endpoint	*Assessment Endpoint*
Fish inventory	Abundance of spawning RB Population structure – length and age
Fish health	Condition – length and weight

2.0 Sampling Sites

Rainbow Trout Spawner Survey sampling sites were located on three watercourses: Davidson Creek, Turtle Creek, and Creek 661. Two box trap sites were located on Davidson Creek, one located in the lowest reach (referred to as DC-1 under the FUP for Condition 3.14 and DC-20 under the AEMP) and one located upstream near the mine footprint in reach 6 (DC-8). The lower Davidson Creek site (DC-1/DC-20) and the Creek 661 site (661-20) are considered impact sites under the AEMP while the Turtle Creek site (TC-15) provides a control site. Additionally, bank walks (i.e., visual encounter surveys) were conducted along 10 sections of Davidson Creek (DC-1 to DC-10). Sampling site locations are presented in Table 2-1 and Figure 2-1. Figure 2-2 provides an overview of the bank walk sections completed on Davidson Creek. Representative photographs of the sites are included in Appendix 1.

3.0 Methods

3.1 Paired Box Traps

3.1.1 Timing

Box trap surveys were conducted from late April 2025 to mid June 2025. Site-specific installation and removal (Table 3-1) followed the implementation framework described in AEMP Plan Version 4.0 (ERM and Triton 2025). Sampling commenced shortly after ice-off and before Rainbow Trout spawners began their migration. Sampling was terminated when the following three criteria were met:

- Rainbow Trout spawning migration had reached its peak in each watercourse.
- We observed minimal upstream movement of adult Rainbow Trout exhibiting signs of sexual maturity.
- A minimum of three consecutive days elapsed with zero to few daily captures in the upstream migration trap (see Section 3.1.2 for details on box traps).

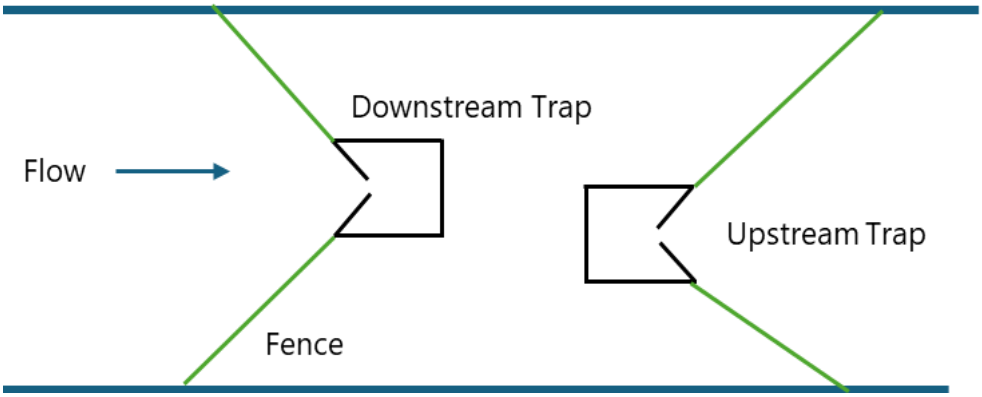
Table 3-1. Rainbow Trout Spawner Survey box trap sampling dates, 2025

Program	*Waterbody*	*Site*	*Install Date*	*Removal Date*
Condition 3.14/AEMP	Davidson Creek	DC-1/DC-20	April 23	June 16
Condition 3.14	Davidson Creek	DC-8	May 4	June 20
AEMP	Creek 661	661-20	April 25	June 19
	Turtle Creek	TC-15	May 1	June 12

3.1.2 Field Methods

Bi-directional, paired box traps were installed at each site within a rigid fish fence spanning the width of the channel. Fish migrating upstream were captured in a box trap with a downstream-facing entrance (hereinafter referred to as the upstream [migration direction] box trap), while fish migrating downstream were captured in a box trap with an upstream-facing entrance (hereinafter referred to as the downstream [migration direction] box trap). A generalized schematic is provided in Figure 3-1.

Figure 3-1. Generalized schematic of box trap and fence setup



During the 2025 sampling season, upstream and downstream box traps were separated from each other by approximately 10m at DC-1/DC-20, 661-20, and DC-8 to reduce water pressure on the fences, reduce turbulence, minimize risk of fish impingement, and improve flow refugia within the boxes. Box traps and fence panels were constructed from 2-by-4 lumber, plywood, and hardware cloth. Based on observations made in 2024 with regards to fish mortality, the hardware cloth walls of each trap box and several fence panels were replaced with half-inch mesh to mitigate the risk of injury or mortality to juvenile and small-bodied fish. Fence panels and box traps were joined together with lag bolts and anchored into the streambed using rebar, t-posts, and sandbags. Where necessary, bracing was added to the downstream side of fences or to the banks of the stream to provide structural support to ensure fences could withstand high flows (representative photos are in Appendix 1).

Box traps were checked daily for structural integrity, isolation of fish passage, and captured fish. Frequency of trap checks was dependent on fish abundance and flow conditions. Captured fish were identified to species level, enumerated, measured for fork length and weight, visually examined for the presence of parasites, previous marks and tags, and deformities, erosion, lesions, and tumours (DELTs). All captured fish were assigned a unique identification code (fish ID). Adult fish were also evaluated for sex and spawning ripeness by assessing externally visible signs or the expression of eggs or milt (i.e., gametes) when palpating the abdomen gently.

Adult Rainbow Trout were scanned with a Passive Integrated Transponder (PIT) tag reader for existing embedded PIT tags. All sexually mature Rainbow Trout (greater than 200 mm in length or fish expressing gametes) with no existing PIT tag were implanted with a new PIT tag, except for a brief period at the end of the sampling season (June 16 to 19, 2025) when the supply of PIT tags on site was exhausted. PIT tags were implanted in the dorsal muscle on the left side of the fish. The unique alpha-numeric identification code of each implanted PIT tag was recorded.

Scale samples were collected from a subset of 30 Rainbow Trout per size class over 200 mm at each site (Table 3-2). Scales were collected from the left side of the fish between the posterior edge of the dorsal fin and the lateral line, approximately two scale rows above the lateral line. At least 10 scales were collected from each fish and were placed into scale envelopes (i.e., coin envelopes), clearly labelled with site name, date, fish ID, species, length, and weight.

Following processing, fish were released upstream or downstream of the fish fence depending on their direction of travel at capture.

Table 3-2. Approximate fish age by size

Age	*Fish Fork Length (mm)*	*Collect Scales*
0+	<80	No
1+	81-125	No
2+	126-200	No
3+	201-275	Yes
4+	276-350	Yes
5+	351-400	Yes
6+	401-450	Yes

Incidental mortalities were processed as described above and were also internally examined to confirm sex and spawning status. Otoliths were extracted from incidental mortalities for age analysis and placed in 1.5-mL plastic vials to prevent breakage. The vials were then placed in clearly labeled envelopes and were left partially open to allow otoliths to dry thoroughly.

Otoliths and scale samples were shipped on September 29, 2025, to North/South Consultants in Winnipeg, Manitoba for age analysis.

Daily in situ water quality measurements were collected at each site using a YSI ProQuatro multiparameter meter (temperature in degrees Celsius [°C], pH, specific conductivity in microsiemens per centimetre [µS/cm], conductivity [µS/cm], dissolved oxygen [DO] in milligrams per litre [mg/L] and percent [%] saturation) and a Lamotte 2020i turbidity meter (turbidity in nephelometric turbidity units [NTU]). Mean daily water temperature for the sampling period was calculated using data from temperature loggers deployed near each box trap sampling site (Table 3-3, Figure 2-1).

Table 3-3. Box trap sampling sites and corresponding temperature logger locations

Box Trap Sampling Site	*Temperature Logger Location*
DC-1/DC-20	ST-08DEEP
DC-8	DC-05
TC-15	TC-10
661-20	661-20

At each box trap, daily measurements of channel (i.e., bankfull) width (m), channel wetted width (m), velocity (m/s), water depth at trap entrances (m), and discharge (m^3/s) across a predetermined area with laminar flow were collected. Velocity and discharge measurements were collected using a Swoffer Model 2100 Current Velocity Meter. Discharge transects were divided into a minimum of 20 intervals for which width, depth, and velocity were measured.

3.1.3 Laboratory Methods

Age analysis was conducted by North/South Consultants Ltd. Scales were removed from the envelopes and sorted under a dissecting microscope to remove any regenerated scales. Three or four of the best representative scales were pressed between two glass slides and viewed under a dissecting microscope with reflected light. Light intensity, magnification, and angle of the scale were adjusted throughout the viewing process.

Large otoliths were thin sectioned and set in Cold Cure epoxy to harden for 48 hours. The nucleus and two points on either side of the nucleus were marked with a fine tipped marker. Using a Struers Minitom low speed sectioning saw, the otolith was sectioned by connecting the line through the nucleus. Size permitting, two sections were taken. The sections of otolith were then permanently mounted on a microscope slide with Cytoseal-60 and viewed under a microscope with transmitted light.

Small otoliths were focus sectioned and set in Cold Cure epoxy to harden for 48 hours. Using a Struers Minitom low speed sectioning saw, the otolith was sectioned on either side of the nucleus leaving the nucleus in the section. The section was then permanently mounted on a microscope slide with Cytoseal-60 and viewed under a microscope with transmitted light.

All otoliths and scales were read by an experienced ageing technician, with structures rated on quality based on the confidence index as follows:

- Very good – annuli are clear with no interpretation problems
- Good – annuli are clear with few easy interpretation problems
- Fair – annuli are fairly clear with some areas presenting easy and moderate interpretation problems
- Poor – annuli are fairly unclear presenting a number of difficult interpretation problems
- Very Poor – annuli are very unclear presenting significant interpretation problems

3.1.4 Quality Assurance/Quality Control

Water quality meters were calibrated each morning prior to use. Calibration solutions for conductivity (1,413 µS/cm) and pH (4.01, 7.01, and 10.01 pH) were used to calibrate the YSI ProQuatro multiparameter meters. The DO sensor was calibrated in the field prior to use; membranes and fluid were replaced when required. Lamotte turbidity meters were calibrated with solution (1, 10, or 100 NTU) in the expected turbidity range for the watercourse.

Field crews were experienced and knowledgeable of fish species present in the local watersheds. A subset of captured fish was photographed for species identification verification. Scale and otolith envelopes and vials were labelled with date, site name, and unique fish ID. Scale and otolith sample inventories were compiled, maintained, and verified prior to shipping to laboratories. Field data, photographs, and mapping information collected on digital platforms were examined for completeness prior to being uploaded nightly to cloud servers to mitigate the risk of data loss.

North/South Consultants Ltd. completed quality control and quality assurance for age structures, which was conducted independently by an alternate ageing technician on a randomly selected subset (10%) of otoliths. If 90% agreement was not achieved with regard to age, all structures were re-analyzed using a three-reader consensus approach.

3.1.5 Data Analysis

Adipose fin clips were used to identify fish that had been previously 'salvaged' and relocated from upstream watercourses within the Mine footprint; all fish captured with adipose fin clips were excluded from calculations of assessment endpoints.

3.1.5.1 Catch-Per-Unit Effort

Catch per unit effort (CPUE) was calculated as the number of adult fish per box trap hour. Because adult Rainbow Trout are the focus of the survey, CPUE was calculated for adult fish only.

3.1.5.2 Spawner Abundance

Total adult abundance was determined based on the number of unique PIT tags encountered during the 2025 sampling season at each box trap site. Recaptures of the same PIT tags within 2025 were excluded from the total abundance tally. Unique PIT tags were considered to be:

- New tags applied during the 2025 sampling season; or
- New encounters of tags implanted in previous sampling years.

As there were two sites in the Davidson Creek system, the number of unique PIT tags encountered at DC-8 and DC-1/DC-20 were added together. Fish included from DC-8 consisted of precocial males and mature fish migrating downstream at DC-8 that had not been encountered at DC-1/DC-20.

Multiple scenarios may have impacted the estimates of spawner abundance, including when fish:

- potentially migrated upstream before the traps were installed;
- potentially bypassed the traps due to loss of trap or fence integrity or isolation; or
- escaped during transfer from trap to holding buckets prior to PIT tagging.

To account for these scenarios, PIT tags were also implanted in untagged fish captured in the downstream migration trap box and were added to the total abundance tally.

To account for the gap in PIT tagging that occurred at the end of the sampling season between June 16 and 19, 2025, as well as spawners that were not tagged due to poor body condition, non-tagged adults were included in the abundance tally. Untagged fish captured migrating downstream during, or after, these dates were included in the abundance tally only if we could confirm that a fish of similar length was not previously captured migrating upstream. Mortalities encountered in the box traps or on the fences were also included if they were untagged but had evidently spawned during the sampling period.

3.1.5.3 Spawner Distribution and Residence Time

The spawner distribution measurement endpoint under the FUP for Condition 3.14 only applied to Davidson Creek. The endpoint was determined by tabulating the numbers of fish captured at each box trap location in Davidson Creek by movement direction.

Rainbow Trout spawners migrate to their spawning sites during a brief period in spring soon after water temperatures rise above 5°C and when high freshet flows allow access to spawning sites. After spawning, the survivors return to their overwintering lake. The time spent migrating within a stream, including the time spent spawning, is referred to as "stream residence time." (AMEC 2013a)

Box trap catches allow stream residence time to be estimated for each population. Residence time values were reported during baseline studies (AMEC 2013a), and although not a specific measurement endpoint under either the FUP for Condition 3.14 or the AEMP Plan Version 4.0, residence time estimates were determined using two methods to provide an update to baseline estimates.

The first method was that used in the baseline report (AMEC 2013a) and consisted of two steps. First, the daily cumulative percent catch for both upstream and downstream box traps at each site was tabulated. Then, the dates at which 50% of the cumulative catch was achieved in both the upstream and downstream box traps were recorded. The number of days between the two dates (at which 50% of the cumulative catch was identified in each migration direction) was defined as stream residence time.

Residence time was also determined using recaptures of PIT tagged fish. Individual fish residence time was determined by the total number of days between the upstream capture and downstream capture.

3.1.5.4 Length, Weight, and Age at 100% Maturity

Prior to conducting analyses with weight and length data, these data were screened for errors and outliers. Rainbow Trout length and weight data were plotted to allow for visual identification of outliers. Outliers were either removed from the data set if they were obvious errors, they were repaired if the error could be identified, or they were included in the analyses if the outlier value was possibly a true value. The rationale for the inclusion or exclusion of the outlier data is included in Section 4.1.8.

Fish size at 100% maturity was calculated by determining the mean length and weight for all mature spawners encountered in each watercourse. Population structures of Rainbow Trout were assessed using length frequency distributions, weight frequency distributions, and length-age regressions for each site. Frequency distributions were created based on fork length, weight, and age measurements collected from captured adult Rainbow Trout. Captured fish without both fork length and weight measurements were removed from analysis. The length frequency distributions between the AEMP impact stream sites (Davidson Creek site [DC-1/DC-20] and the Creek 661 site [661-20]) and the control site (Turtle Creek site [TC-15]) were compared using a two-level

Kolmogorov-Smirnov test. Eight individual length measurements were considered the minimum sample size for the Kolmogorov-Smirnov test.

Length-age regressions were developed for all sites, except at DC-8 where the sample size was insufficient for statistical analysis (n = 1). Comparisons of the growth rates of Rainbow Trout among sites was conducted by analysis of covariance (ANCOVA). Assumptions of normality and homogeneity of variance were tested using Shapiro-Wilk and Levene's tests. Site-specific growth rate was determined using the slope of the length-age relationships. The interaction of regression slopes of the length-age relationship was tested among sites prior to conducting the ANCOVA. ANCOVA can only proceed if the slopes among the sites are parallel to one another. Non-parallel slopes can indicate that the growth rate among sites is different. Finally, Tukey adjusted pairwise comparisons were used to determine differences in growth rates between sample sites.

3.1.5.5 Condition

Condition indices provide a comparative measure of the plumpness of fish. Two condition indices were used for this program: Relative condition (K_n) and Fulton's condition factor (K). Both indices make use of the weight (g) and length (mm) of individual fish.

Relative condition (K_n) was calculated by comparing the measured fish weight (W) to the expected fish weight (W_E) as follows:

$$K_n = \frac{W}{W_E}$$

The expected fish weight (W_E) was calculated from the length/weight data from reference sites and from historical data, as described in the Follow-up Programs for Condition 3.14 (Palmer 2023).

Fulton's condition factor (K) is widely use in fisheries and general fish biology studies (Fulton 1902, 1904; Nash et al. 2006; Ricker 1975). Fulton's condition factor was calculated according to the following equation:

$$K = 100{,}000\ x\ \frac{W}{L^3}$$

Both relative and Fulton's conditions were compared among sites. First, the distributions were tested for normality using an Anderson-Darling test. If the data were normally distributed, a single factor analysis of variance (ANOVA) followed by a Tukey's multiple comparison test was computed to compare the respective condition among sites. If the data were not normally distributed, a Kruskal-Wallis test by ranks was conducted with a Steel-Dwass test for multiple comparisons. Statistical significance was assumed if $p < 0.05$.

3.2 Condition 3.14 Visual Bank Walk Surveys

3.2.1 Field Methods and Timing

Visual bank walk surveys were conducted from May 6 to June 14, 2025, at ten 200-m long sections on Davidson Creek (DC-1 to DC-10) to evaluate the distribution of Rainbow Trout spawning. Bank walk surveys were conducted approximately once per week; specific dates are shown in Table 3-4.

Table 3-4. Condition 3.14 Davidson Creek visual bank walk survey dates by survey section

Survey Section	*Total Number of Surveys*	*Survey Dates*	
		May	**June**
DC-1	6	6, 12, 20, 29	4, 11
DC-2	6	6, 14, 21, 28	4, 11
DC-3	6	7, 17, 21, 28	5, 12
DC-4	6	8,17,27	1,8,13
DC-5	6	6, 16, 24, 30	6, 12
DC-6	6	7, 13, 21, 29	5, 11
DC-7	5	8,16, 27	2, 9
DC-8	6	7, 15, 23, 29	5, 15
DC-9	5	11, 24, 31	7, 14
DC-10	5	11, 24, 31	7, 14

Efforts were made to replicate the bank walk extents from 2024. Upstream and downstream extents were identified via the presence of old flagging and Global Positioning System (GPS) coordinates taken in 2024. Surveys were conducted by a two-person crew walking in an upstream direction and outside the wetted width where possible to avoid disturbing spawning Rainbow Trout and their redds. Live and dead Rainbow Trout were counted individually by each crew member. Live Rainbow Trout spawners were further categorized into the following groups depending on their observed behaviour:

- Holding/migrating,
    - Holding – unpaired and actively shoaling, usually under cover or in deep pools
    - Migrating – swimming steadily upstream, usually unpaired
- Spawning – courting with one or more individuals, digging or guarding redds usually with caudal fin wear, or
- Spent – lethargic, usually in slow pools, backwater or drifting downstream, potential damage to body/fins.

Counts in each category were compared between crew members at the end of the survey section and the highest number in each category was recorded.

Redds were identified based on observations of cleaned gravels and depressions in suitable spawning areas. The location of identified redds was recorded using GPS.

3.2.2 Data Analysis

3.2.2.1 Spawner Abundance, Density, and Distribution

Spawner abundance was calculated from weekly bank walk survey data as the total number of live (i.e., holding/migrating, spawning, and spent) and dead adult Rainbow Trout observed. Spawner abundance was calculated for individual sections and pooled for all sections. The total live and dead fish observed were also used to calculate the linear (fish per metre [fish/m]) and areal (fish per square metre [fish/m^2]) density of spawning Rainbow Trout in each 200-m bank walk section. Distribution was assessed by comparing the percentage of all Rainbow Trout spawners observed at each bank walk section.

3.2.2.2 Redd Abundance

Redd abundance was calculated as the number of redds observed in each section during the survey period.

4.0 Results

4.1 Paired Box Traps

4.1.1 Field Program

At DC-1/DC-20, high water levels and discharge (greater than 1.00 cubic metres per second [m^3/s]) compromised the integrity of the upstream box trap and related fence panels on four days throughout the sampling period. On April 26, 2025, high flows washed large amounts of debris onto the fence, increasing water pressure and risk of fish impingement. Two panels were temporarily removed to relieve pressure and mitigate further damage; these were reinstalled the same day once debris had been cleared. On April 27, 2025, excessive scouring caused the upstream box trap and several fence panels to shift, creating large gaps underneath. As a result, the box trap and associated fences were repositioned, and additional sandbags were added to prevent further scouring. On April 28, 2025, one fence panel rotated vertically, and the substrate was scoured out underneath. The fence panel was forced back into place and secured to adjacent panels that same day. On May 19, 2025, heavy rains increased flows causing three fence panels to break, resulting in a loss of site isolation. These were repaired and reinforced with sandbags the same day.

The downstream box trap at DC-1/DC-20 lost site isolation for four days during the sampling period. On May 18, 2025, heavy precipitation caused high flows which damaged one fence panel. This was repaired with sandbags and rebar the same day. On May 19, 2025, high flows damaged one fence panel. The site remained open until May 21, 2025, when flows decreased to a level where repairs could be made safely.

At 661-20, high water levels and discharge (greater than 1.00 m^3/s) compromised the integrity of the upstream box trap over six days during the sampling period. On May 3, 2025, high water levels and discharge (up to 1.61 m^3/s) caused water to overflow the banks of the creek and flow around the box traps. Several fence panels came loose, allowing water to flow freely underneath the fence. The fence panels were replaced and reinforced with bracing and sandbags. Additional fence panels and sandbags were placed along the banks to extend the isolation fence length. Site isolation was re-established on May 4, 2025. On May 19, 2025, a large hole was found under the upstream box trap, preventing the box from effectively trapping fish. Site isolation was reestablished on May 22, 2025, once flows decreased to a point at which the box trap could be re-installed safely.

The integrity of the 661-20 downstream box trap was compromised for 12 days over the sampling period. On April 29, 2025, the box trap shifted due to high water levels and discharge and was removed to relieve pressure on the fence. It was re-installed on May 5, 2025, after the flows had decreased to a safe level. On May 18, 2025, the downstream box trap became dislodged by high water levels and a discharge of up to 1.47 m^3/s and was washed downstream onto the upstream box trap. It was replaced on May 22, 2025, after flows had decreased to a safe level.

At several points throughout the sampling season at DC-1/DC-20 and 661-20, bracing was added to the tops of upstream and downstream fences to strengthen them under high flows. Sandbags

were placed along the bottoms and sides of box traps and fences to prevent scouring of substrate from around the edges and to minimize the risk of undercutting banks.

No issues with site isolation or box traps were experienced at TC-15 or DC-8 throughout the sampling period.

4.1.2 Laboratory Analysis

A total of 396 age samples were collected from adult Rainbow Trout and submitted for laboratory age analysis. A breakdown of age samples by site and age structure type is provided in Table 4-1. Age results were not received for several samples (*n* = 61) because the collected scales were deemed to be regenerated and thus did not contain the growth patterns necessary to estimate age. Aging lab results are provided in Appendix 3.

Table 4-1. Adult Rainbow Trout age samples by structure type

Site	***Number of Samples Submitted***		***Number of Age Results***		***Total Number of Age Results***
	Scales	**Otoliths**	**Scales**	**Otoliths**	
DC-1/DC-20	136	9	114	8	122
DC-8	0	1	0	1	1
661-20	111	32	90	32	121
TC-15	106	1	88	1	89

4.1.3 Box Trap Effort, Catch, and CPUE

Total effort, catch and PIT tagging totals, and CPUE by site and migration direction are presented in Table 4-2. CPUE is only reported for Rainbow Trout spawners because they are the focus of the survey.

Table 4-2. Rainbow Trout box trap effort, catch, tagging results, and CPUE

Program	*Waterbody*	*Site*	*Migration direction*	*Total effort (trap hours)*	*Number of adult RB captured*[a]	*Number of juvenile RB captured*[a]	*Total number of RB pit tagged*	*Total number of PIT recaptures*	*CPUE (adult RB/trap hour)*
Condition 3.14/AEMP	Davidson Creek	DC-1/ DC-20	Upstream	1288.11	417(1)	217(10)	404	12	0.325
			Downstream	1102.11	37(8)	230(9)	9	13	0.034
Condition 3.14	Davidson Creek	DC-8	Upstream	1120.99	38	43	28	8	0.035
			Downstream	1132.81	1(1)	3	0	2	0.002

	Turtle Creek	TC-15	Upstream	1006.49	260(2)	2	253	5	0.258
			Downstream	1005.46	5	0	3	2	0.005

Note: [a]Number of mortalities is indicated in brackets as a subset of the total captures. Multiple recaptures of the same fish are included in recapture totals. RB = Rainbow Trout

4.1.3.1 Davidson Creek – DC-1/DC-20

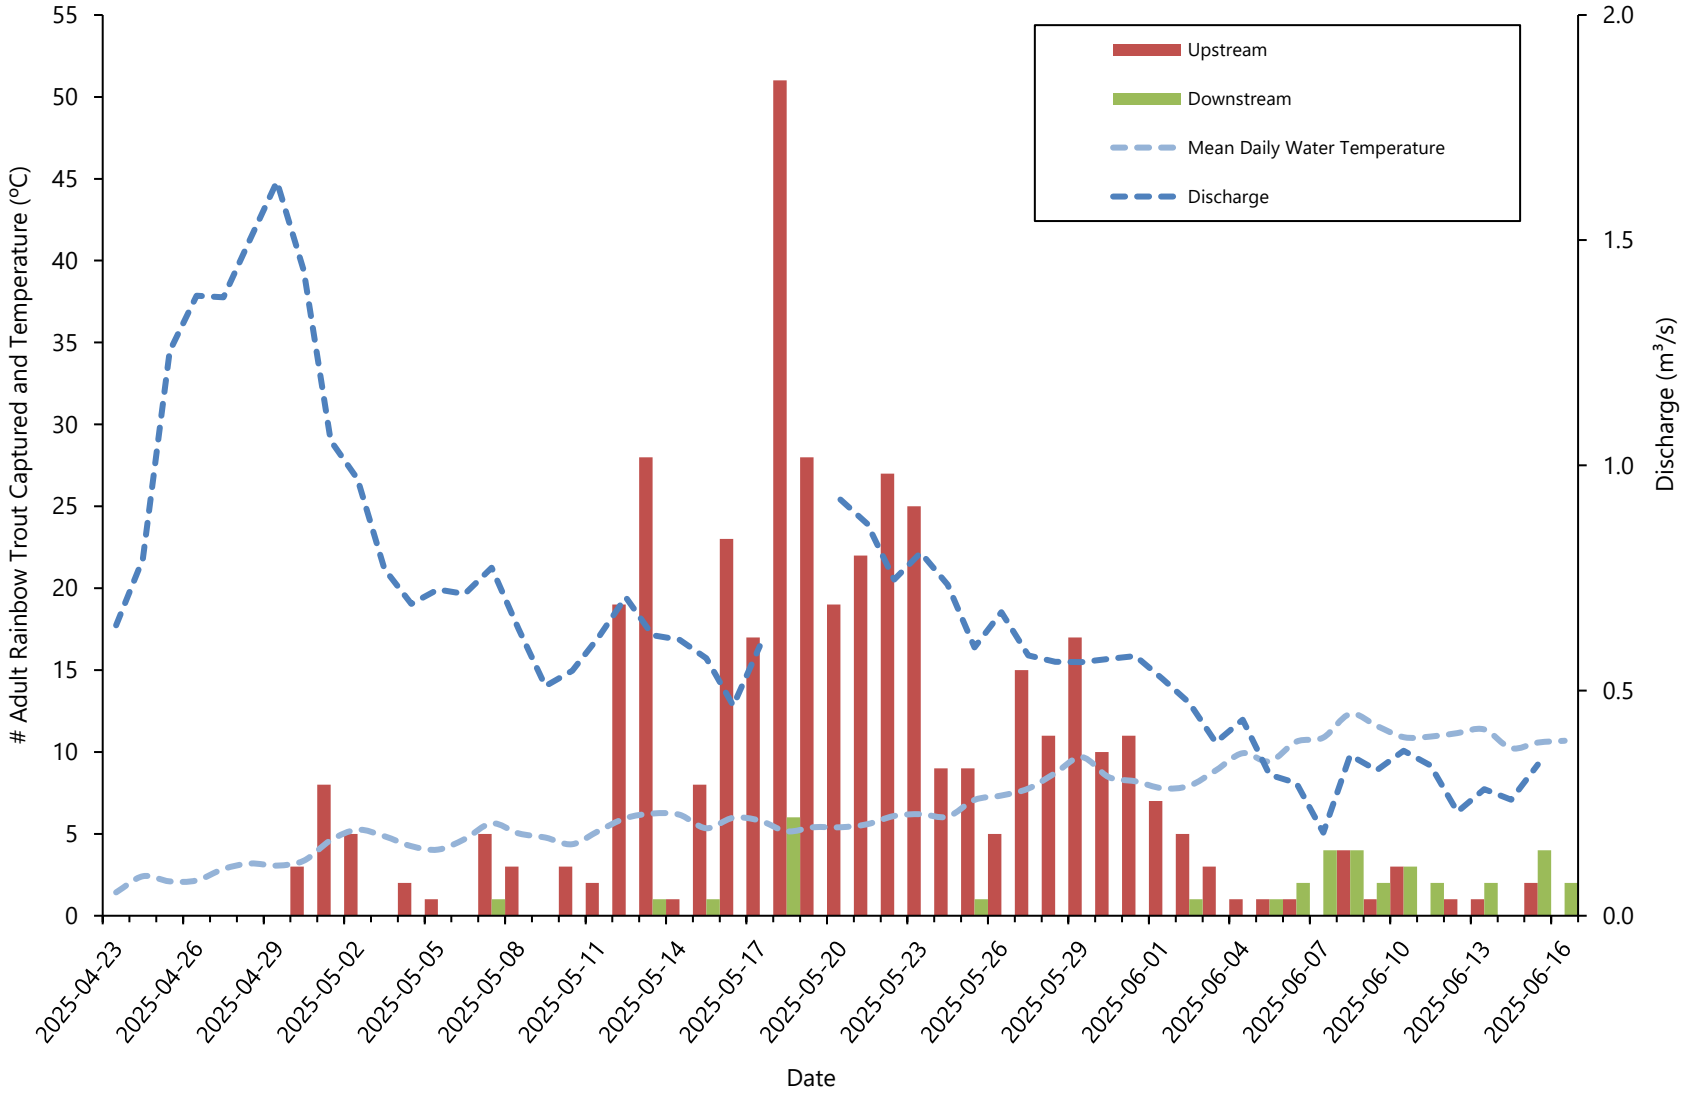
Adult Rainbow Trout captures by migration direction at DC-1/DC-20, with mean daily water temperature and discharge, are provided in Figure 4-1. Most of the fish at this site were captured moving in the upstream migration direction. Fish were first captured once the water temperature rose above 3°C at the end of April, with initial migration occurring following peak freshet, and peak migration beginning May 13, 2025 when water temperatures were consistently above 5°C. Daily upstream migration peaked at 51 adult Rainbow Trout on May 18, 2025.

A total of 902 Rainbow Trout, comprising 455 adults and 447 juveniles were captured at DC-1/DC-20 during a total of 2,390.22 trap-hours. Several captured fish were not included in the analysis. A Rainbow Trout spawner with a clipped adipose fin was not included since this was a fish relocated from an upstream watercourse. A considerable number of juvenile Rainbow Trout (n = 447) were captured. Incidental bycatch consisted of one Northern Pikeminnow (*Ptychocheilus oregonensis*), two Prickly Sculpin (*Cottus asper*), and 12 Mountain Whitefish (*Prosopium williamsoni*).

During the sampling period, nine adult and 19 juvenile Rainbow Trout mortalities occurred. Of the nine adult mortalities, seven were spent Rainbow Trout spawners that washed down into the downstream migration fence or box trap after being exhausted by high flows or were caught on the fence after they had died. The remaining two mortalities were impinged on the fence or box trap during periods of high flows. Of the 19 juvenile mortalities, 15 were impinged on the fence panels during high flows, three were gilled in the mesh of the fence panels, and one perished after being placed in a bucket with a larger Rainbow Trout. Modifications to the box traps were made throughout the sampling period to minimize the risk of fish impingement and improve flow refugia.

PIT tags were implanted in 413 adult Rainbow Trout. Of the 25 instances of PIT tagged recaptures, 19 were recaptures of fish tagged in 2025 (and were not included in the abundance total), and six were recaptures of fish tagged at the same site in 2024 (and were included in the abundance total).

Figure 4-1. Adult Rainbow Trout captures by migration direction in Davidson Creek at DC-1/DC-20 with mean daily water temperature and discharge



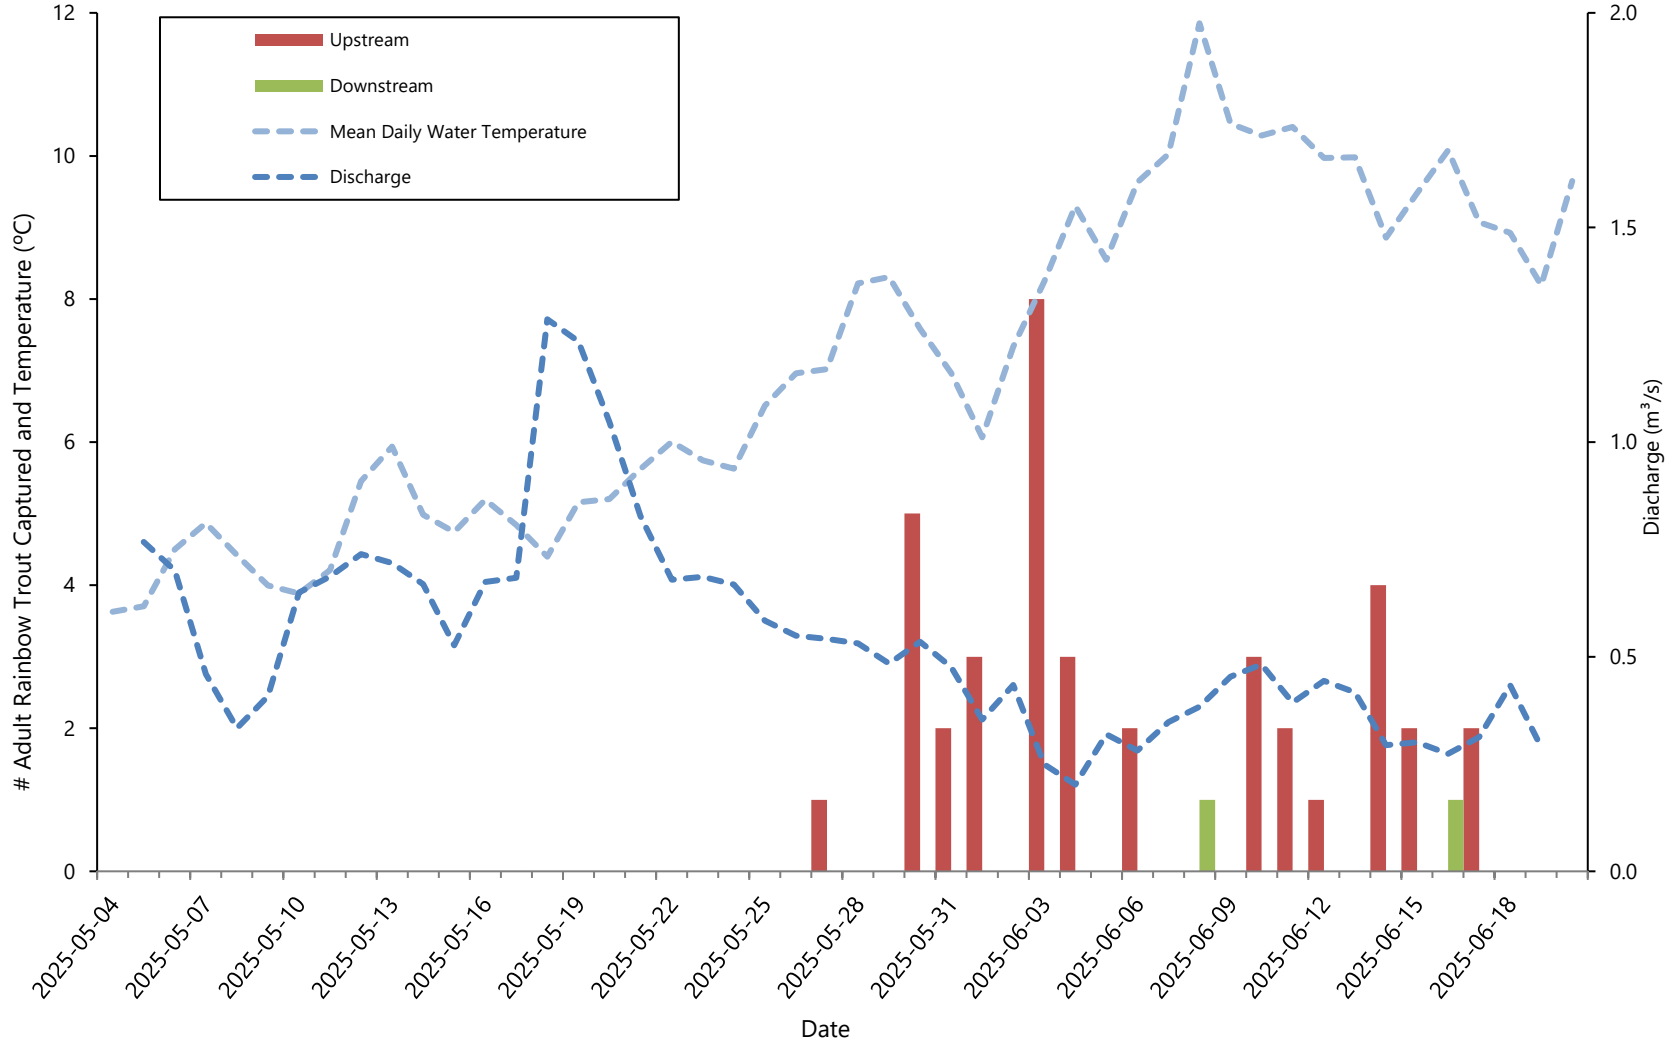
4.1.3.2 Davidson Creek – DC-8

Adult Rainbow Trout captured by migration direction with mean daily water temperature and discharge are provided in Figure 4-2. Most of the fish caught at this site were captured in the upstream box trap. The spawning migration commenced after the peak freshet, with peak migration occurring later in the spring at DC-8 compared to DC-1/DC-20. The highest daily number of fish captured (n = 8) at this site occurred on June 3, 2025.

A total of 86 Rainbow Trout, comprising 40 adults and 46 juveniles were captured over a total of 2,253.8 trap-hours. A Rainbow Trout spawner with a clipped adipose fin was not included in the analysis since this was a fish relocated from an upstream watercourse. No other incidental species were captured. One adult spawner mortality occurred in the downstream migration box trap, likely after the flows had exhausted the spent spawner. There were no juvenile mortalities.

PIT tags were implanted in 28 adult Rainbow Trout. Of the 10 recaptures at DC-8, two were recaptures of fish tagged at the same site in 2025, and one was a recapture of a fish tagged during the 2025 sampling season at DC-1/DC-20 and was caught two more times at DC-8, once going upstream and once downstream. These three fish were not included in the abundance total. The two other recaptures were fish tagged at the same site in 2024, and they were included in the abundance total.

Figure 4-2. Adult Rainbow Trout captures by migration direction in Davidson Creek at DC-8 with mean daily water temperature and discharge



4.1.3.3 Creek 661-20 – 661-20

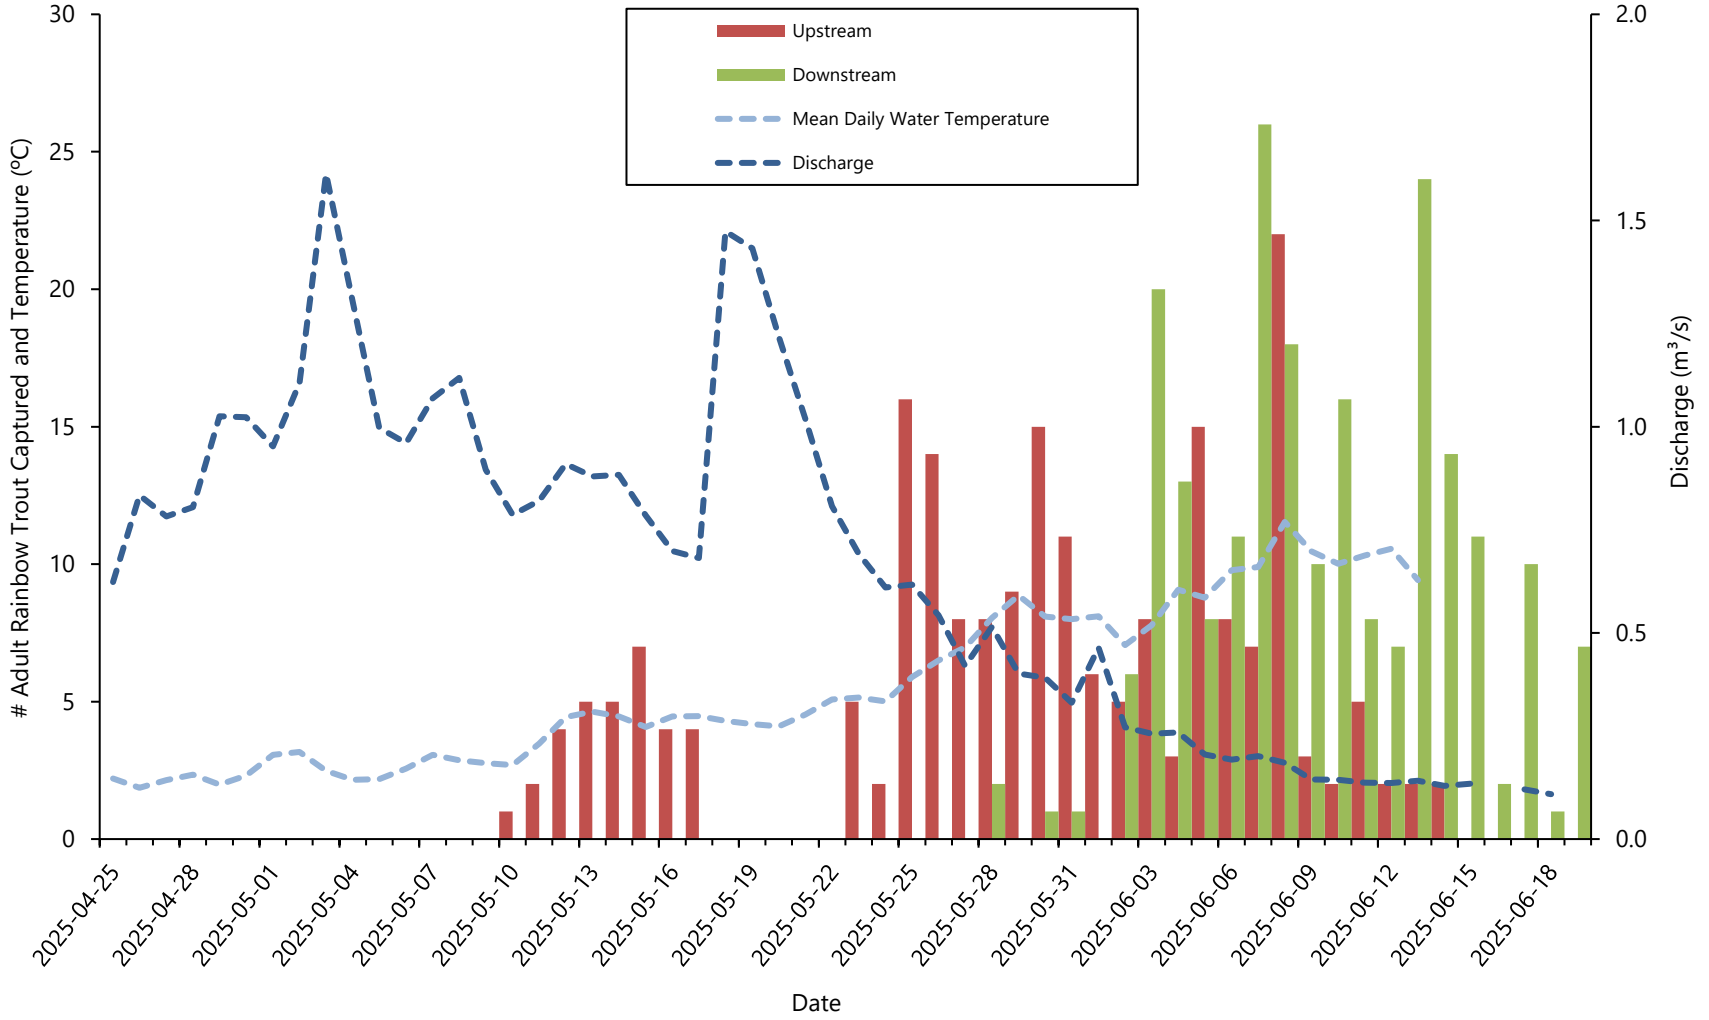
Adult Rainbow Trout captures by migration direction at 661-20, with mean daily water temperature and discharge are shown in Figure 4-3. Upstream captures initially occurred on May 10, 2025, once mean daily water temperature rose above 2ºC. The number of fish captured moving upstream (*n* = 210) and downstream (*n* = 212) were fairly even, with downstream captures beginning on May 28, 2025. Mass upstream migration began at the end of May once mean daily water temperature rose above 5ºC and discharge decreased following peak freshet. Peak downstream migration was observed a week after the mass upstream migration began. The highest number of fish (*n* = 26) were captured moving downstream on June 7, 2025. There was a gap of four days from May 18 to May 22, 2025, when creek flows became too high to maintain trap integrity. Fish were not captured during these four days.

A total of 818 Rainbow Trout, comprising 422 adults and 396 juveniles were captured over a total of 2,266.44 trap-hours of effort. Incidental bycatch consisted of one Mountain Whitefish.

Thirty-three adult spawner mortalities occurred during the sampling period. Four spawners died in the upstream migration box: two from impingement; one died not long after capture, presumably exhausted by high flows; and one was found on the stream bank after the water had receded from a period of high flows. The remaining 29 were end-of-life spawners that died in the downstream migration box presumably after having been exhausted from spawning. There were seven juvenile moralities over the course of the sample period, three in the upstream trap from being impinged on the fence, and four in the downstream trap from being impinged in the trap.

A total of 299 fish were PIT tagged at 661-20. Of the 24 instances of PIT tagged fish recaptures, 23 were from the 2025 sampling season, and one was from a fish tagged at the same site in 2024.

Figure 4-3. Adult Rainbow Trout captures by migration direction in Creek 661 at 661-20 with mean daily temperature and discharge



Note: Creek flows from May 18, 2025 to May 22, 2025 were too high to maintain trap integrity. Site isolation was reestablished on May 22, 2025.

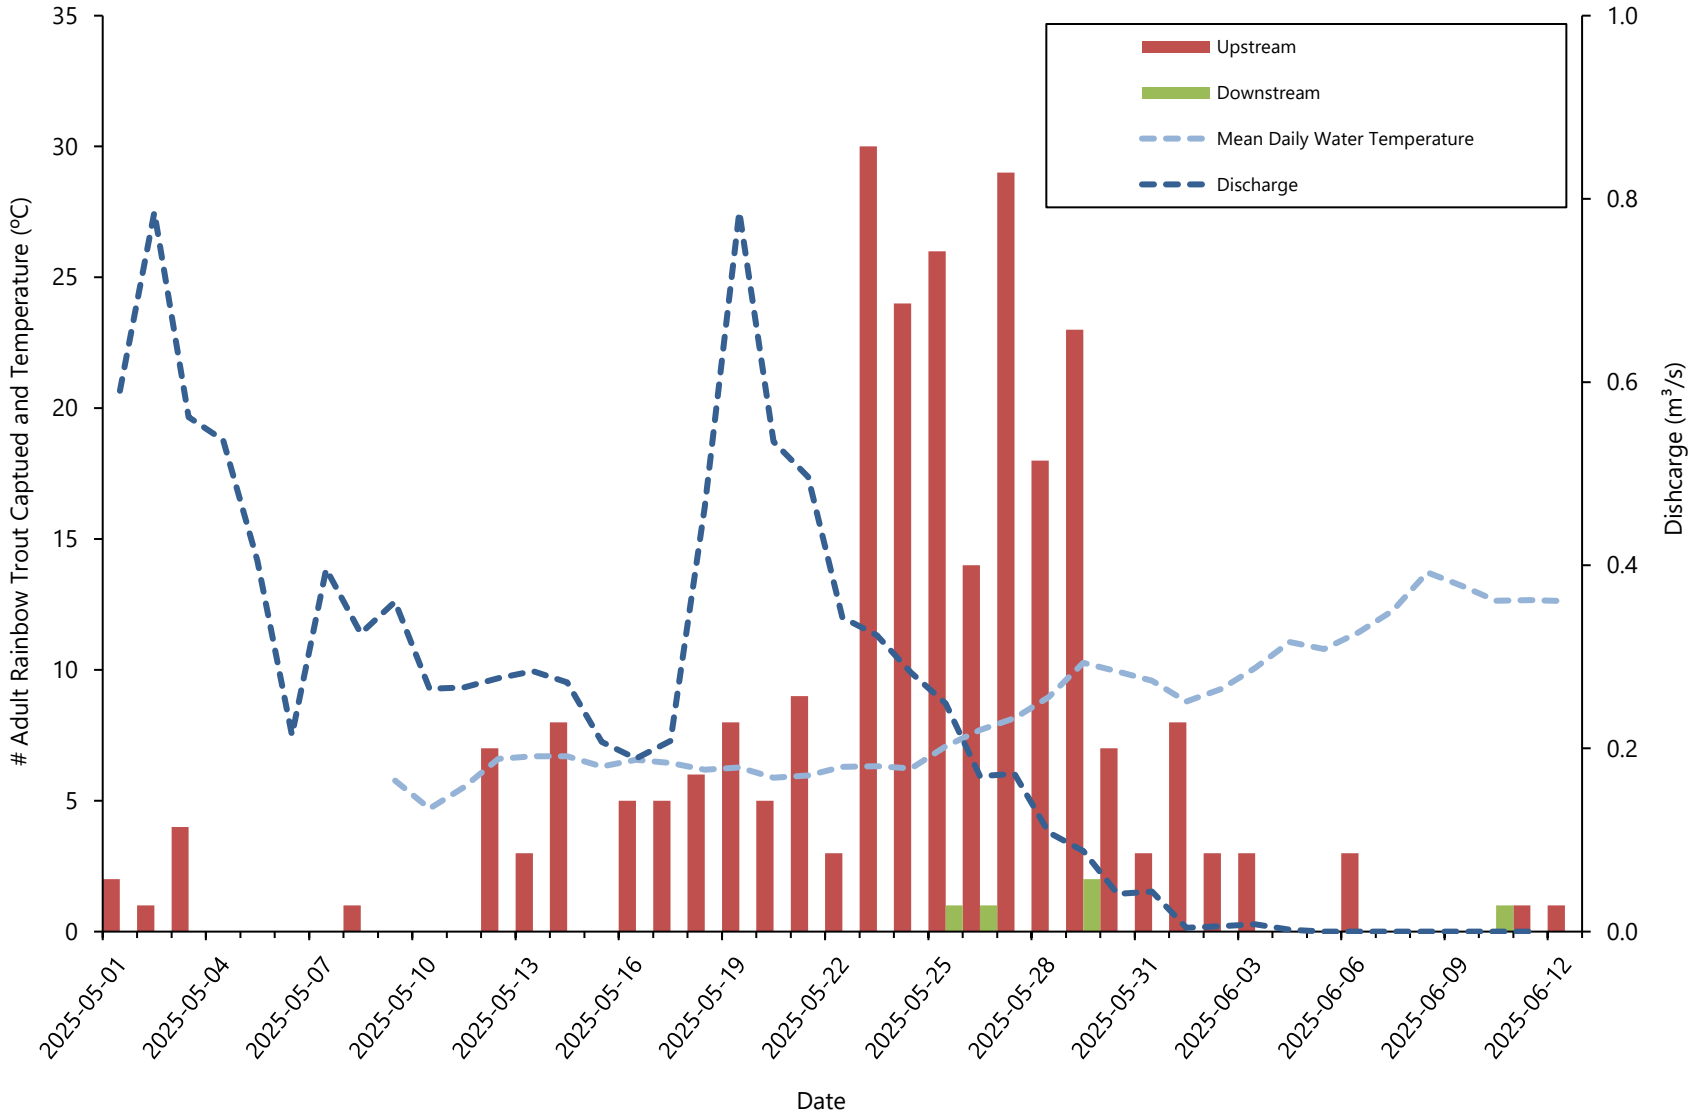
4.1.3.4 Turtle Creek – TC-15

Adult Rainbow Trout captures by migration direction at TC-15, with mean daily water temperature and discharge are provided in Figure 4-4. Fish were first captured migrating upstream on May 1, 2025, during the initial freshet. Temperature readings were not available since the logger at TC-10 was installed on May 9, 2025. The largest daily number of fish (*n* = 30) was captured on May 23, 2025 as mean daily water temperature rose above 6°C and discharge fell to 0.32 m^3/s. Due to low water levels in mid-June (0.04 m^3/s at the mouth of the downstream box trap and 0.02 m^3/s at the mouth of the upstream box trap; Appendix E), the traps were removed on June 13 to reduce the risk of fish being stranded.

A total of 267 Rainbow Trout, comprising 265 adults and 2 juveniles were captured at TC-15 over a total of 2,011.95 trap-hours of effort. No incidental species were captured at this site. There were two adult spawner mortalities in the upstream trap, attributed to spawners at the end of their lives. There were no juvenile mortalities.

A total of 256 Rainbow Trout were PIT tagged at TC-15. Of the seven instances of recaptured fish, three were from the 2025 sampling season, three were fish tagged at the same site in 2024, and one was a fish tagged at the same site in 2023.

Figure 4-4. Adult Rainbow Trout captures by migration direction in Turtle Creek at TC-15 with mean daily water temperature and discharge



4.1.4 Spawner Abundance

Total adult abundance was determined based on the number of unique PIT tags encountered during the 2025 sampling season at each box trap site (Table 4-3). DC-1/DC-20 and DC-8 were combined for these calculations as they are part of the same creek system.

Table 4-3. Spawner abundance in each study area

	Davidson Creek	***Creek 661***	***Turtle Creek***
Spawner abundance	465	396	262

4.1.5 Distribution

The spawner distribution measurement endpoint only applied to Davidson Creek under the FUP for Condition 3.14. The total number of adult Rainbow Trout captured by movement direction at both Davidson Creek sites is provided in Table 4-2. The capture of 30 unique individual Rainbow Trout at DC-8 (ten fish were removed as they were recaptures) equates to 6.9% of the total spawner population captured at the lower Davidson Creek site (DC-1/DC-20). This suggests that the majority of spawning occurs in the reaches between the lower and upper Davidson Creek box trap locations.

4.1.6 Residence Time

Rainbow Trout residence time results are shown in Table 4-4. Residence time based on 50% of the cumulative catch in upstream and downstream box traps ranged from 4 to 19 days. Figure 4-5 presents the cumulative catch by migration direction and illustrates when 50% of the accumulated catch occurred in both directions. The considerably longer residence time at DC-1 is clearly seen in Figure 4-5.

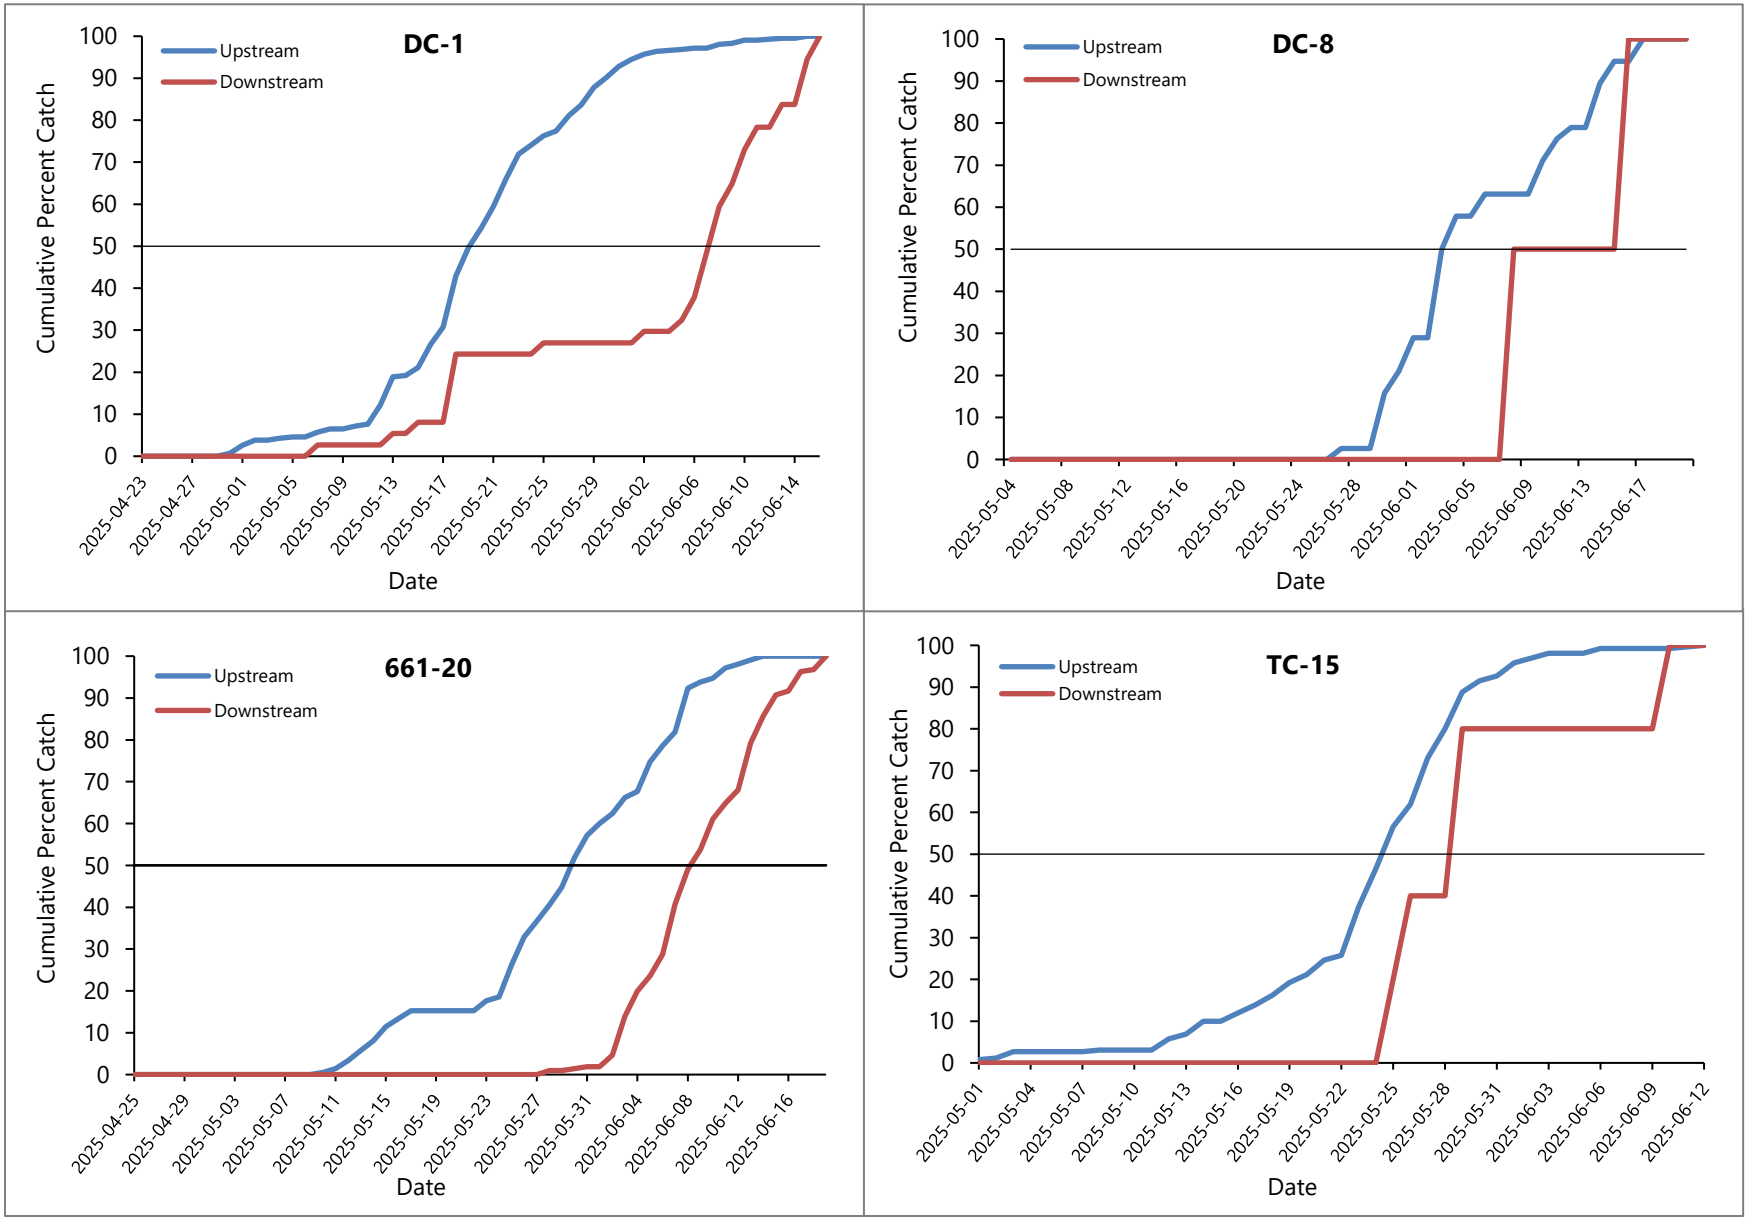
Summary statistics of residence time determined from PIT tag recaptures are also provided in Table 4-4. Mean residence time based on PIT tag recaptures range from 3 days at TC-15 to approximately 17 days at DC-1/DC-20. PIT tag-based estimates of residence time were similar to those based on the cumulative catch.

Table 4-4. Residence Time for Rainbow Trout captured in box traps

Waterbody	***Site***	***Residence time (days) based on cumulative catch***	***Mean residence time (days) based on PIT recaptures***			
			n	**Min**	**Max**	**Mean ± SD**
Davidson Creek (lower)	DC-1/DC-20	19	17	3	29	16.6 ± 6.7
Davidson Creek (upper)	DC-8	5	3	2	9	-
Creek 661	661-20	9	23	0	35	10.6 ± 9.0
Turtle Creek	TC-15	4	3	1	5	3.0 ± 1.2

Note: SD = standard deviation

Figure 4-5. Cumulative percent catches of adult Rainbow Trout at each box trap



4.1.7 Size and Age at 100% Maturity

The minimum, maximum, and mean length and weight (±1 standard deviation) values for adult Rainbow Trout are provided in Table 4-5. Length-frequency and weight-frequency distributions of adult Rainbow Trout captured at each site are shown in Figure 4-6 and Figure 4-7, respectively. Significant differences ($p < 0.05$) in the distribution of lengths were found between the impact sites (DC-1/DC-20 and 661-20) and the control site (TC-15) (Table A4-1).

Length-weight data are provided in Figure 4-8 and length at age data are provided inFigure 4-9. The slopes of the length-age relationship showed that TC-15 had the fastest growth rate, DC-1/DC-20 had intermediate growth, and 661-20 had the slowest growth rate. Slope comparisons indicated that the growth rate at DC-1/DC-20 was not significantly different than that at TC-15, and the growth rate at 661-20 was significantly lower than that at TC-15 (Table A4-2).

Table 4-5. Minimum, maximum, and mean length and weight by age of adult Rainbow Trout captured at each box trap site

Site	Age	Fork Length (mm)				Weight (g)			
		n	Min	Max	Mean ± SD	n	Min	Max	Mean ± SD

4.1.8 Fish Health – Condition

The weight to length relationships by site are shown in Figure 4-10. Differences in these relationships among sites were assessed by examining relative condition (K_n) and Fulton's condition factor (K).

Initial data screening did not reveal any outlier data. Mean relative condition (K_n) and Fulton's condition factor (K) with 95% confidence intervals are shown in Figure 4-10. Individual relative condition (K_n) and Fulton's condition factor (K) values are provided in Appendix 2.

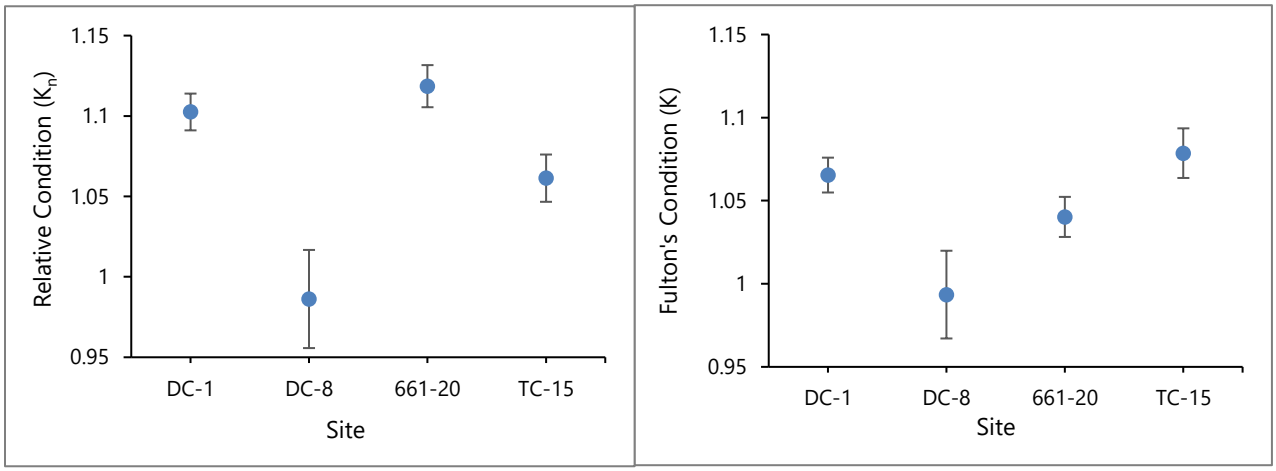
Data were found to be non-normally distributed; therefore, a Kruskal-Wallis test by ranks followed by a Steel-Dwass test were computed to compare both relative condition and Fulton's condition factor between sampling sites. There were significant differences among sites ($p < 0.001$) in both relative condition and Fulton's condition factor.

Pairwise comparisons found significant differences ($p < 0.001$) in the mean relative condition between the three exposure sites (i.e., DC-1/DC-20, 661-20, and DC-8) and the control site (TC-15) (Table A4-3). No significant difference in mean relative condition was found between impact sites 661-20 and DC-1/DC-20. Mean relative condition of Rainbow Trout captured at DC-8 was significantly lower than that at all other sites.

Pairwise comparisons found significant differences ($p < 0.05$) in mean Fulton's condition of adult Rainbow Trout between two of the exposure sites (661-20 and DC-8) and the control site (TC-15) (Table A4-4). Fulton's condition at exposure site DC-1/DC-20 was not different than at TC-15. Fulton's condition was greater at both DC-1/DC-20 and TC-15 compared to 661-20 which may be explained by the timing of Rainbow Trout capture; the majority of fish at DC-1/DC-20 and TC-15 were captured migrating upstream in a gravid or pre-spawn state. Rainbow Trout at 661-20 were captured migrating in both directions, with a higher proportion of captures exhibiting a spent or post-spawn state. Gonadal development adds additional weight relative to length which leads to an inflated Fulton's condition, while the deposition of eggs and milt during spawning reduces the weight of a fish relative to its length leading to a smaller Fulton's condition.

The pattern of differences between the two condition indices were different, suggesting that most differences observed are not ecologically important. Both condition indices at DC-8 were significantly smaller than at all other sites (except for Fulton's condition at 661-20). This difference may be attributable to the higher proportion of precocial spawning males captured at this site. These fish were generally smaller in size compared to fish at other sites.

Figure 4-10. Mean relative condition (K_n) and Fulton's condition factor (K), with 95% confidence intervals, of adult Rainbow Trout captured at each box trap site



4.2 Condition 3.14 Visual Bank Walk Surveys

4.2.1 Spawner Abundance, Density, and Distribution and Redd Abundance

Results of the Rainbow Trout bank walk surveys are summarized by site in Table 4-6. The visual surveys were impacted by water clarity and high flow conditions throughout much of the spawning season, limiting visual observations of fish and redds. A total of 31 live fish and 7 dead fish were observed throughout the program, with the majority of spawning Rainbow Trout observed in the DC-1 and DC-3 survey sections. No adult Rainbow Trout or redds were observed in DC-5, DC-6, DC-9, or DC-10 survey sections. Linear density of Rainbow Trout ranged from 0 to 0.095 fish/m. Areal density ranged from 0 to 0.021 fish/m^2. Seven redds were documented among the DC-1, DC-3, and DC-4 bank walk survey sections.

Table 4-6. Total Number of Rainbow Trout spawners and redds observed by site during bank walk surveys

Survey Section	Survey Length (m)	Wetted Width[1] (m)	Survey Area (m^2)	Fish Count						Fish Density		Relative Distribution %	Max Redd Count
				Holding/ Migrating	Spawning	Spent	Total Live	Total Dead	Total	Linear (fish/m)	Areal (fish/m^2)

5.0 Closure

The 2025 Rainbow Trout Spawner Survey program was successful in collecting and evaluating data relating to the long-term monitoring requirements under the FUP for Condition 3.14 and the AEMP Plan Version 4.0. This 2025 report was compiled using data collected between April and June 2025, over a 57-day period, to characterize the Rainbow Trout spawning populations within Davidson Creek, Creek 661, and Turtle Creek. Fieldwork included Rainbow Trout capture using bi-directional box traps, visual bank walk spawner surveys, water quality and discharge measurements, fish processing, and age structure collection. The 2025 monitoring results will contribute to evaluating Davidson Creek, Turtle Creek, and Creek 661 with respect to mitigation effectiveness and to detect Mine-related effects under the FUP for Condition 3.14 and the AEMP.

Table A2-2. Box Trap Survey Information

Program	Waterbody	Site	Survey Date	Crew Names	Air Temperature (°C)	Cloud Cover (%)	Wind	Precipitation	Comments
AEMP	Creek 661	661-20	2025-04-25	JESSICA COURTIER, SYDNEY REIMER	10	25	Calm	None	Site setup commenced, upstream migration direction trap installed.
AEMP	Creek 661	661-20	2025-04-26	JANELLE COLE, JAMES GEORGE, QUAIN SULIN (BWG)	10	0	Calm	None	Gap below three fence panels due to flows eroding the substrate and pushing sand bags out.
AEMP	Creek 661	661-20	2025-04-27	JANELLE COLE, JAMES GEORGE, QUAIN SULIN (BWG)	10	0	Calm	None	Fence panels full of debris which increased water levels, water flowing around fence panels on both left and right banks. Bottom of 3 fence panels scoured out.
AEMP	Creek 661	661-20	2025-04-28	JANELLE COLE, JAMES GEORGE, CHRISTIAN CARNEVALE	15	50	Calm	None	Right wing wall of US trap scoured underneath. DS trap and fence panels installed in afternoon.
AEMP	Creek 661	661-20	2025-04-29	SEBASTIAN VAN LEEUWEN, JESSIE MAY	10	75	Light	None	Water flowing around US fences on both banks. The DS trap box is loose and not secured; water flowing around sides and underneath of box. Box was removed as it could not be secured with 2 people and was about to be washed downstream into the other trap box and fences.
AEMP	Creek 661	661-20	2025-04-30	SEBASTIAN VAN LEEUWEN, JESSIE MAY	17	0	Calm	None	US box remains instream and functional though water was flowing around fences on both banks and underneath trap box. Water level dropped 1 foot after cleaning. The DS trap box is out of water and not functional though the fences are still in stream.
AEMP	Creek 661	661-20	2025-05-01	SEBASTIAN VAN LEEUWEN, JESSIE MAY	22	0	Calm	None	Water flowing around on both banks of US trap box. Significant debris on fence. Crew conducted maintenance to fences and box. Discharge slowly dropping at less than 1m3/s.
AEMP	Creek 661	661-20	2025-05-02	SEBASTIAN VAN LEEUWEN, JESSIE MAY	9	0	Calm	None	Discharge slightly higher than yesterday at over 1m3/s. Water flowing into forest and around fences on both banks. Added sandbags to the US trap box and fences.
AEMP	Creek 661	661-20	2025-05-03	SEBASTIAN VAN LEEUWEN, JESSIE MAY	6	25	Calm	None	Upstream trap box had one blown out fence panel and water was going over the banks and around the trap on both sides. Also excessive scouring underneath of several panels. Left fence panels open to relieve pressure and will be coming back another time once flows have slowed down from last nights rainfall runoff.
AEMP	Creek 661	661-20	2025-05-04	SEBASTIAN VAN LEEUWEN, JESSIE MAY	5	25	Calm	None	The stream was still over the banks flowing around the trap and two fence panels are blown out. Waiting for lower flows to put in fence panels and DS trap box.
AEMP	Creek 661	661-20	2025-05-05	JESSICA COURTIER, SYDNEY REIMER	10	100	Light	None	Fences on US trap repaired. DS trap and associated fencing re-installed.
AEMP	Creek 661	661-20	2025-05-06	SEBASTIAN VAN LEEUWEN, JESSIE MAY	6	100	Calm	None	
AEMP	Creek 661	661-20	2025-05-07	SEBASTIAN VAN LEEUWEN, JESSIE MAY	2	25	Calm	None	
AEMP	Creek 661	661-20	2025-05-08	SEBASTIAN VAN LEEUWEN, JESSIE MAY	2	0	Calm	None	
AEMP	Creek 661	661-20	2025-05-09	SEBASTIAN VAN LEEUWEN, JESSIE MAY	2	100	Calm	None	
AEMP	Creek 661	661-20	2025-05-10	CHRISTIAN CARNEVALE, SYDNEY UMLAH	7	100	Calm	None	
AEMP	Creek 661	661-20	2025-05-11	CHRISTIAN CARNEVALE, SYDNEY UMLAH	7	25	Calm	None	
AEMP	Creek 661	661-20	2025-05-12	CHRISTIAN CARNEVALE, SYDNEY UMLAH	5	25	Calm	None	Two RB spawners observed in area between two trap boxes in afternoon but could not find any holes in fencing or scouring under trap boxes. Spawners likely entered area overnight when water levels rise due to debris build up on fencing. Sandbags added to right bank near US trap box in afternoon and will add isolation fencing tomorrow.
AEMP	Creek 661	661-20	2025-05-13	CHRISTIAN CARNEVALE, SYDNEY UMLAH	12	0	Calm	None	Crew caught all fish between the trap boxes using a pole seine and located the possible hole in the fencing on the US trap box right bank side. Hole was temporarily blocked at end of day and will be fixed properly tomorrow.
AEMP	Creek 661	661-20	2025-05-14	CHRISTIAN CARNEVALE, ETHAN ROACH (BWG)	5	75	Calm	Snow	
AEMP	Creek 661	661-20	2025-05-15	CHRISTIAN CARNEVALE, ETHAN ROACH (BWG)	5	50	Calm	None	
AEMP	Creek 661	661-20	2025-05-16	CHRISTIAN CARNEVALE, ETHAN ROACH (BWG)	5	100	Calm	Light Rain	RB caught between the traps when walking between traps, noticed at least 4 more between traps so crew filled more sandbags and sealed the fences further. Crew found a couple holes on the US side of US trap box right bank wing wall that fish may be fitting through and filled with sandbags.
AEMP	Creek 661	661-20	2025-05-17	CHRISTIAN CARNEVALE, ETHAN ROACH (BWG)	6	100	Calm	Light Rain	
AEMP	Creek 661	661-20	2025-05-18	CHRISTIAN CARNEVALE, ETHAN ROACH (BWG)	5	100	Calm	Light Rain	Water flowing over both banks around US and. DS trap box fencing. Crew cleaned fencing, reinforced banks with more sandbags and repaired bracing on right bank fence panel that stripped off of tree. In afternoon, US trap box was resting on DS trap box and flow at site had significantly increased so crew could not reestablish isolation.
AEMP	Creek 661	661-20	2025-05-19	CHRISTIAN CARNEVALE, ETHAN ROACH (BWG)	6	100	Calm	Intermittent Rain Shower	Site was in same condition as yesterday afternoon with DS trap box resting on US trap box and fencing. Crew could only clean fences and installed another bracing for US trap box fence panels. Flow is too high to move DS trap box out of watercourse.
AEMP	Creek 661	661-20	2025-05-20	SYDNEY UMLAH, MAGGIE LENART (BWG)	10	75	Calm	None	Downstream trap box still dislodged from fence panels, no trapping taking place
AEMP	Creek 661	661-20	2025-05-21	SYDNEY UMLAH, ETHAN ROACH (BWG)	10	100	Calm	Intermittent Rain Shower	DS trap box still dislodged from fence, not functional
AEMP	Creek 661	661-20	2025-05-22	SYDNEY UMLAH, JESSIE MAY	9	100	Calm	None	
AEMP	Creek 661	661-20	2025-05-23	SYDNEY UMLAH, JESSIE MAY	9	100	Calm	None	Large hole under fence at DS trap, packed with sandbags
AEMP	Creek 661	661-20	2025-05-24	SYDNEY UMLAH, JESSIE MAY	10	100	Calm	None	Fish found in between trap boxes. Fish observed coming and going in the trap box. Small hole found and was fixed with a sandbag
AEMP	Creek 661	661-20	2025-05-25	SYDNEY UMLAH, JESSIE MAY	14	100	Calm	None	
AEMP	Creek 661	661-20	2025-05-26	JESSICA COURTIER, KRIS MELNYCHUK (BWG)	15	100	Calm	Intermittent Rain Shower	
AEMP	Creek 661	661-20	2025-05-26	SYDNEY UMLAH, JESSIE MAY	12	50	Light	None	Holes in mesh on US box fence, plugged with sandbags temporarily
AEMP	Creek 661	661-20	2025-05-27	SYDNEY REIMER, JESSIE MAY	15	50	Light	None	Small hole in downstream trap, likely not large enough for a large fish
AEMP	Creek 661	661-20	2025-05-28	SYDNEY REIMER, JESSIE MAY	14	75	Light	None	Small hole in DS fence on the right bank, filled with sandbags
AEMP	Creek 661	661-20	2025-05-29	SYDNEY REIMER, JESSIE MAY	8	100	Light	Intermittent Rain Shower	
AEMP	Creek 661	661-20	2025-05-30	SYDNEY REIMER, JESSIE MAY	12	100	Calm	None	
AEMP	Creek 661	661-20	2025-05-31	SYDNEY REIMER, JESSIE MAY	8	100	Calm	None	
AEMP	Creek 661	661-20	2025-06-01	SYDNEY REIMER, JESSIE MAY	10	100	Calm	None	
AEMP	Creek 661	661-20	2025-06-02	SYDNEY REIMER, JESSIE MAY	10	100	Calm	None	Visited site twice. Seined one fish from between the trap boxes. Several fish holding in front of the downstream trap boxes. Six spawners seined and released them downstream

Table A2-2. Box Trap Survey Information

Program	Waterbody	Site	Survey Date	Crew Names	Air Temperature (°C)	Cloud Cover (%)	Wind	Precipitation	Comments
AEMP	Creek 661	661-20	2025-06-03	SYDNEY REIMER, KRIS MELYNCHUK (BWG)	12	25	Calm	None	
AEMP	Creek 661	661-20	2025-06-04	SYDNEY REIMER, KRIS MELYNCHUK (BWG)	12	75	Calm	None	
AEMP	Creek 661	661-20	2025-06-05	SYDNEY REIMER, STEVEN HAYWARD (BWG)	12	100	Calm	None	
AEMP	Creek 661	661-20	2025-06-06	SYDNEY REIMER, QUAIN SULIN (BWG)	15	25	Light	None	3 mortalities in the downstream box. Believed to be spent fish that washed in after they died
AEMP	Creek 661	661-20	2025-06-07	SYDNEY REIMER, QUAIN SULIN (BWG)	8	25	Calm	None	One mort in downstream box
AEMP	Creek 661	661-20	2025-06-08	SYDNEY REIMER, QUAIN SULIN (BWG)	16	0	Calm	None	4 adult morts, 1 juvenile mort
AEMP	Creek 661	661-20	2025-06-09	SYDNEY REIMER, TATE FOWLER (BWG), SYDNEY UMLAH	12	0	Calm	None	
AEMP	Creek 661	661-20	2025-06-10	SYDNEY UMLAH, TATE FOWLER (BWG)	12	0	Calm	None	
AEMP	Creek 661	661-20	2025-06-11	SYDNEY UMLAH, MARCO HAUST (BWG)	15	0	Calm	None	
AEMP	Creek 661	661-20	2025-06-12	SYDNEY UMLAH, TATE FOWLER (BWG)	12	100	Calm	None	
AEMP	Creek 661	661-20	2025-06-13	SYDNEY UMLAH, TATE FOWLER (BWG)	10	50	Calm	None	
AEMP	Creek 661	661-20	2025-06-14	SYDNEY UMLAH, ETHAN ROACH (BWG)	15	50	Calm	None	
AEMP	Creek 661	661-20	2025-06-15	SYDNEY UMLAH, TATE FOWLER (BWG)	13	25	Calm	None	
AEMP	Creek 661	661-20	2025-06-16	SYDNEY UMLAH, BRENT HERON (MARMAC), DEANNA KETLO (MARMAC)	15	100	Calm	None	Swoffer not working, no discharge measurements. Flows appeared similar to yesterday
AEMP	Creek 661	661-20	2025-06-17	SYDNEY UMLAH, ETHAN ROACH (BWG)	12	50	Calm	None	
AEMP	Creek 661	661-20	2025-06-18	SYDNEY UMLAH, MAGGIE LENART (BWG)	12	75	Calm	None	
AEMP	Creek 661	661-20	2025-06-19	SYDNEY UMLAH, CHRISTOPHER KETLO (MARMAC), SHANE BOYD (MARMAC)	14	75	Calm	None	
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-04-23	JESSICA COURTIER, SYDNEY REIMER	0	75	Calm	None	Upstream trap was installed yesterday but fence install was not completed.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-04-24	CHRISTIAN CARNEVALE, MATTHEW CARTER	8	0	Calm	None	The left bank side wing wall was significantly leaning when crew arrived on site. Fence panels fixed and placed sandbags where sediment had eroded.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-04-25	JESSICA COURTIER, SYDNEY REIMER, CHRISTIAN CARNEVALE	10	0	Calm	None	Large scour downstream of both wing walls occurred overnight. Holes underneath fencing filled in with sandbags.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-04-26	JESSICA COURTIER, SYDNEY REIMER	7	0	Light	None	When traps were checked in the morning, a fence panel was found broken, and the fences on either side of the trap box had been shifted by high flows that came up in the night. The creek bed under all the fence panels had been scoured out significantly, and the whole trap box had been shifted.Fence panels were removed on either side of the trap box to lessen the pressure on the fence and pulled the trap box. Trap box and fences were re-installed in the afternoon.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-04-27	JESSICA COURTIER, SYDNEY REIMER, CHRISTIAN CARNEVALE	5	50	Calm	None	Heavy debris accumulation on fences and trap caused right bank fence panels to blow out completely. Panels found downstream of trap, missing pieces of rebar. Box trap significantly scoured out and shifted. Left bank fence remained intact. US box trap and fences reinstalled in afternoon. Reinforced with bracing back to banks. Crew also worked to install DS migration direction box trap however only managed to install wing walls fences.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-04-28	JESSICA COURTIER, SYDNEY REIMER	5	75	Light	None	Left wing wall fence panel on US trap not intact. One panel scoured out underneath and rotated vertically. Panel repaired during afternoon checked. Fencing isolation achieved at approx 16:30.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-04-29	JESSICA COURTIER, SYDNEY REIMER, JANELLE COLE, CHRISTIAN CARNEVALE, JAMES GEORGE	5	25	Light	None	Upon arrival in am, one fence panel on left bank wing wall scoured and rotated out slightly. Fences cleaned and repaired. Attempted to install DS Trap box but flows too high
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-04-30	JESSICA COURTIER, SYDNEY REIMER	5	0	Calm	None	Upon arrival in the am, one panel on left wing wall had snapped and rotated, somewhat scoured underneath. Fence
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-01	JESSICA COURTIER, SYDNEY REIMER	7	25	Light	None	DS trap installation completed in the morning.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-02	JESSICA COURTIER, SYDNEY REIMER	10	0	Light	None	Both traps and fence lines held overnight. Significant debris build up; Fences cleaned.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-03	JESSICA COURTIER, SYDNEY REIMER	2	25	Calm	None	
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-04	JESSICA COURTIER, SYDNEY REIMER	5	25	Calm	None	Both fences intact at morning check and in afternoon. Water and debris build up lower than previous days.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-05	JESSICA COURTIER, SYDNEY REIMER	2	100	Light	Intermittent Rain Shower	
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-06	JESSICA COURTIER, SYDNEY REIMER	10	100	Light	None	
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-07	CHRISTIAN CARNEVALE, JANELLE COLE	5	50	Calm	None	
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-08	CHRISTIAN CARNEVALE, JANELLE COLE	7	25	Calm	None	When crew checked trap boxes in afternoon, one adult RB was observed in area between two traps. Crew could not capture fish and checked the fencing on both US and DS trap boxes and no holes located. Likely entered through undercut left bank tunnel around US trap left bank wing wall
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-09	CHRISTIAN CARNEVALE, JANELLE COLE	4	100	Calm	None	
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-10	JANELLE COLE, JESSIE MAY	2	100	Light	None	
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-11	JANELLE COLE, JESSIE MAY	7	25	Calm	None	Water levels and flow has increased due to recent rainfall events.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-12	JANELLE COLE, JESSIE MAY	8	25	Light	None	Fish remaining in the upstream trap box at the end of the day and several seen downstream of trap box
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-13	JANELLE COLE, ETHAN ROACH	10	25	Calm	None	Fish remaining in the trap box at the end of the day and several seen downstream of the trap box
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-14	JANELLE COLE, SYDNEY UMLAH	5	75	Calm	None	
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-15	JANELLE COLE, SYDNEY UMLAH	6	75	Calm	None	Four adult RB observed between upstream and downstream trap boxes.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-16	JANELLE COLE, SYDNEY UMLAH	7	75	Light	None	Four western toads in downstream trap box
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-17	JANELLE COLE, SYDNEY UMLAH	6	100	Light	Light Rain	Water levels and flow have increased due to recent precipitation.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-18	JANELLE COLE, SYDNEY UMLAH	12	50	Calm	Intermittent Rain Shower	Water levels and flow has increased significantly due to heavy precipitation. One downstream trap box fence panel broke loose and scoured out a large hole. Repaired with sand bags and 2x4/rebar to support the back of the fence panel

Table A2-2. Box Trap Survey Information

Program	*Waterbody*	*Site*	*Survey Date*	*Crew Names*	*Air Temperature (°C)*	*Cloud Cover (%)*	*Wind*	*Precipitation*	*Comments*
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-19	JANELLE COLE, SYDNEY UMLAH	9	50	Moderate	None	High flows and large amounts of debris dammed up the fence panels. Crew arrived on site to discover 3 fence panels broken at the upstream trap box and 1 fence panel broken off at the downstream trap box. Repairs were made to the upstream trap box fence panels, however, crew was unable to repair downstream trap box fence panel due to high flows
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-20	CHRISTIAN CARNEVALE, JANELLE COLE then JESSICA COURTIER. JESSIE MAY	8	25	Calm	None	US trap and fences intact. DS trap fences remain damaged and require repairs when water levels receded.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-21	JESSICA COURTIER, JESSIE MAY	5	25	Calm	None
