Creek 661	661-20	2025	2	impact	after	0.0005	0.0003	4.730	Y
Creek 661	661-05	2017	10	impact	before	0.0004	0.0002	4.684	Y

Outliers on log scale:

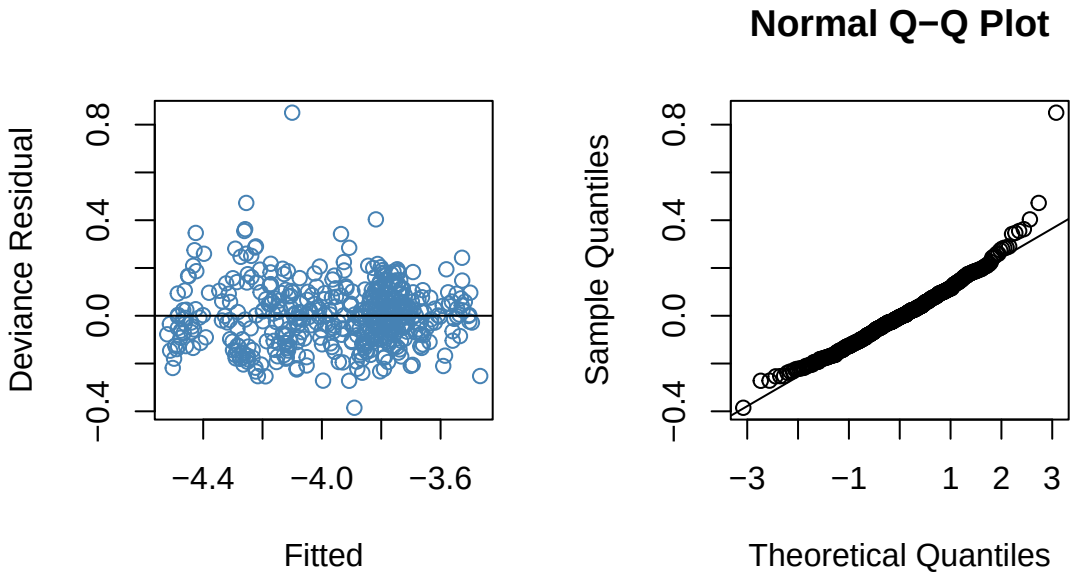
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-03	2024	1	impact	after	-3.250	-4.100	6.412	Y
Fawnie Creek (Control)	FC-01	2021	12	control	before	-3.783	-4.255	3.562	Y
Creek 661	661-05	2017	10	impact	before	-3.414	-3.818	3.042	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.01018	0.01018	1	7.007	0.5789	0.472	
period	0.01719	0.01719	1	15.206	0.9775	0.338	
class:period	0.46846	0.46846	1	457.739	26.6416	<0.001	1.57e-06

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
479	0.0822	29%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-03, 661-04, 661-05, 661-10, 661-20) and control sites (661-01, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

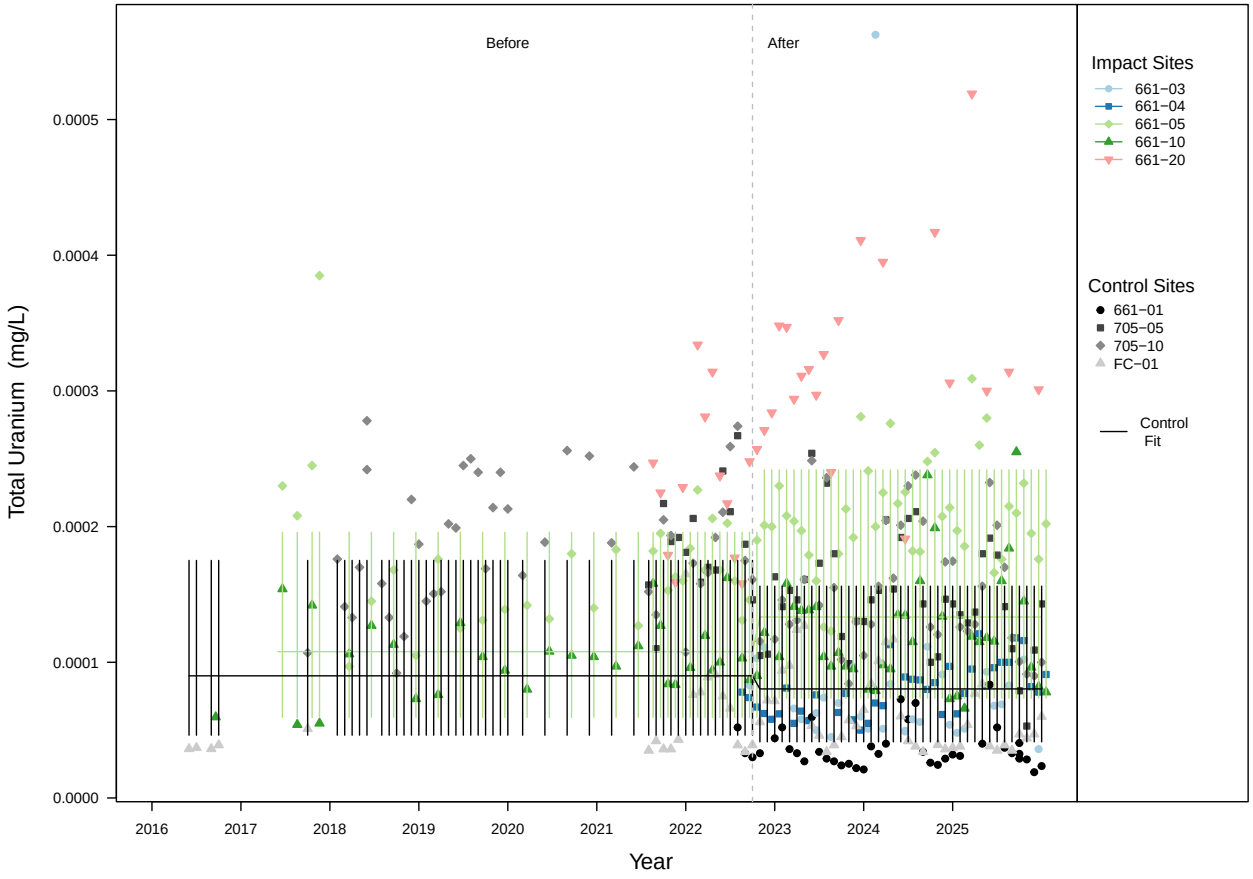
Impact vs.	Estimate	Significance
control sites	0.1415	significant

Conclusion:

The change in Total Uranium concentrations at the impact sites from *before* to *after* was significantly (*adjusted p =* 1.57×10^{-6}) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

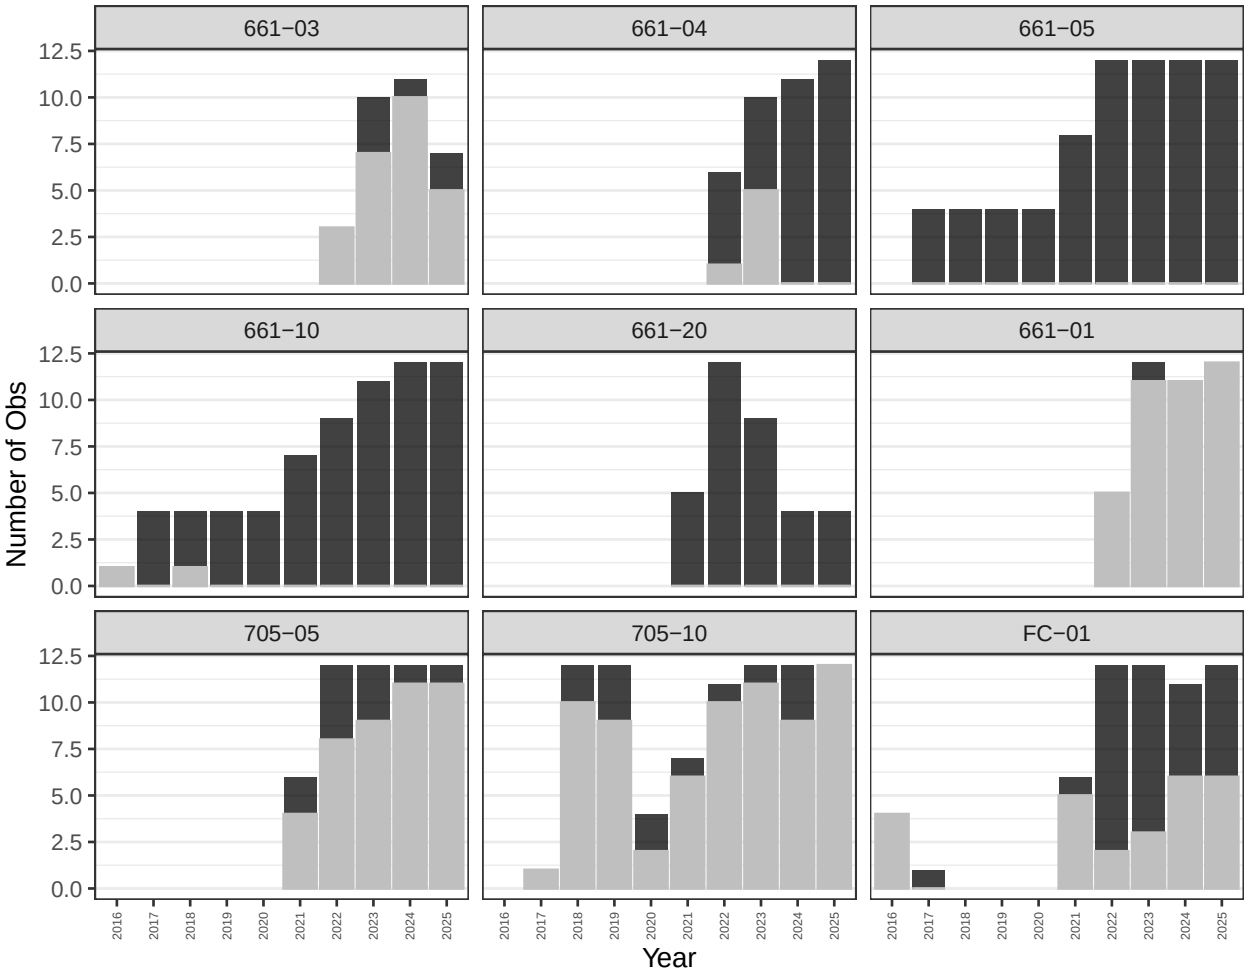
Final Summary Table

Variable	Total Uranium
Watershed	Creek 661
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	Yes

A-12.2.30 Total Vanadium

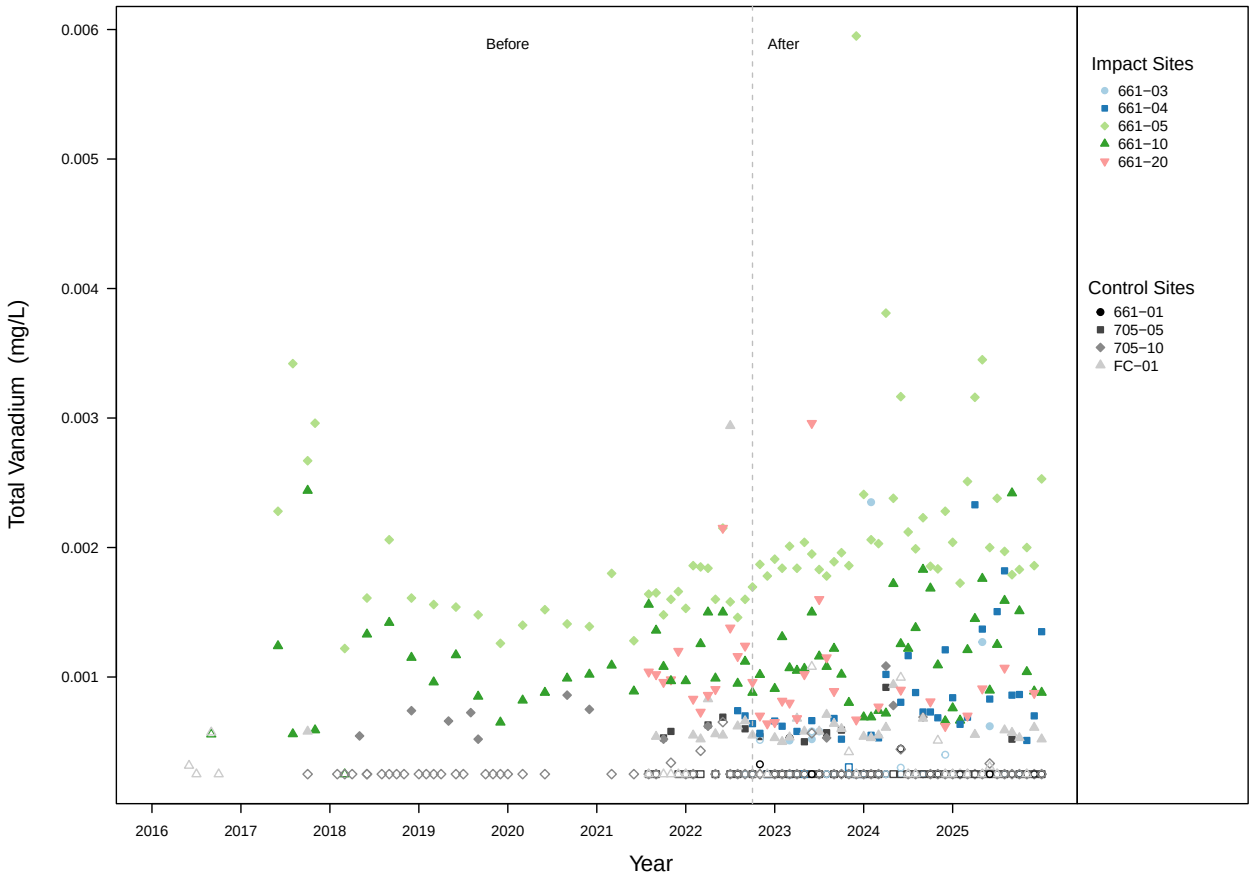
1 Creek 661

1.1 Censored Data The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Conclusion:

Statistical analyses were not conducted due to censoring or availability of observations. Below is a summary figure of all observations in the dataset.



Note: Open symbols represent cases where the results were below the sample detection limit.

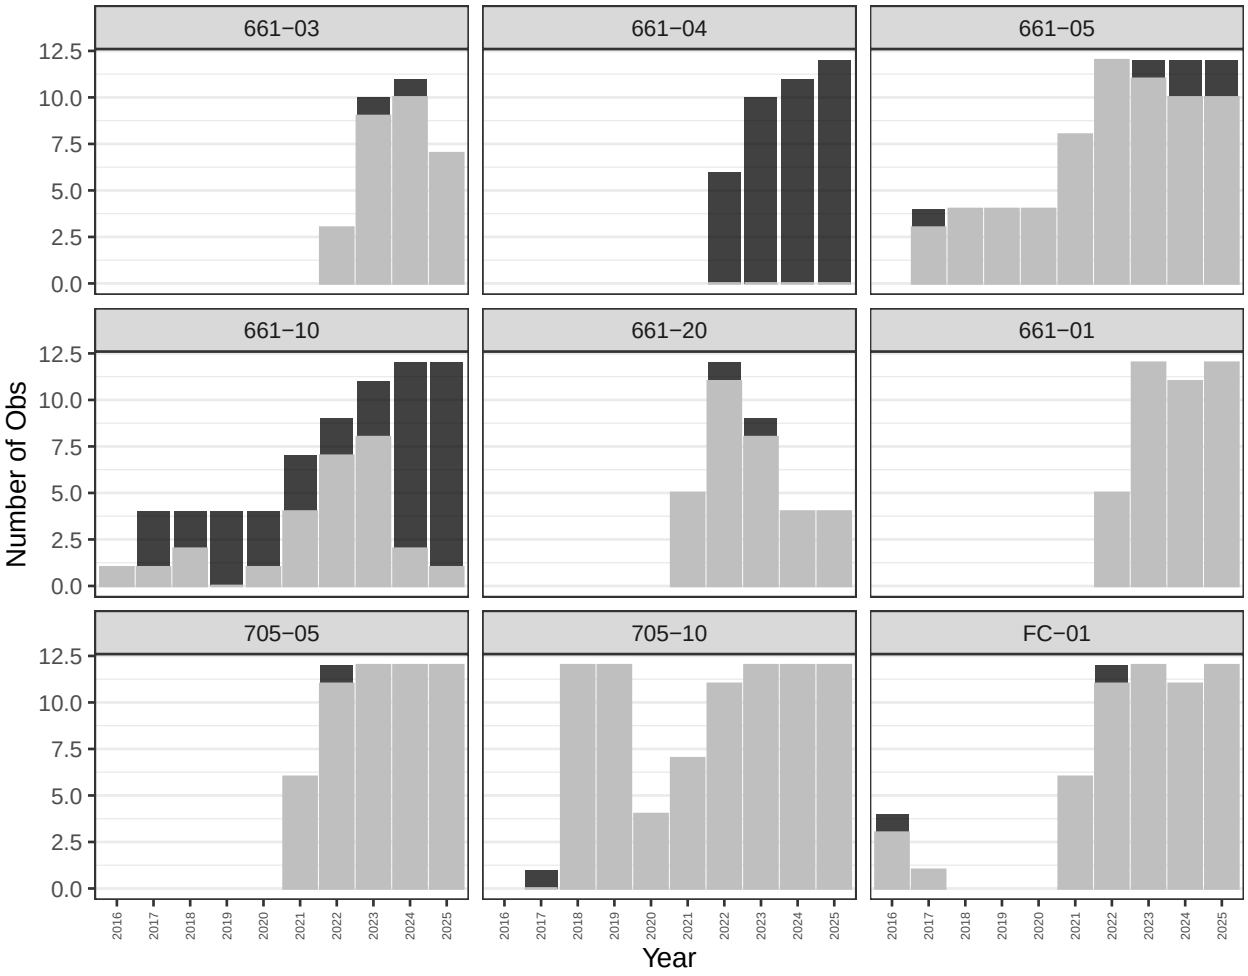
Final Summary Table

Variable	Total Vanadium
Watershed	Creek 661
Waterbody	Stream
Streams Removed	All Excluded
Data Transformation	N/A
Model Type	N/A
Benchmark	None
Significant BACI term	N/A

A-12.2.31 Total Zinc

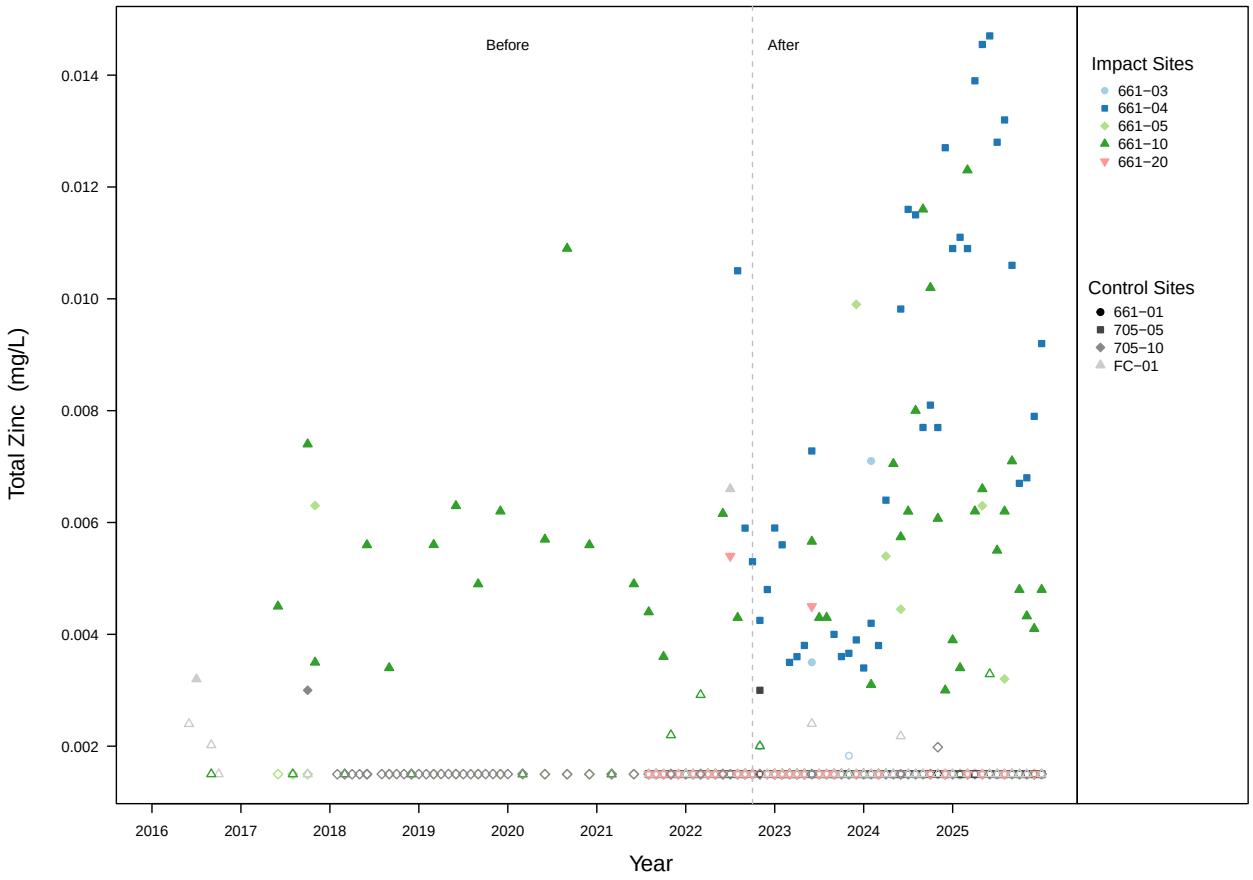
1 Creek 661

1.1 Censored Data The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Conclusion:

Statistical analyses were not conducted due to censoring or availability of observations. Below is a summary figure of all observations in the dataset.



Note: Open symbols represent cases where the results were below the sample detection limit.

Final Summary Table

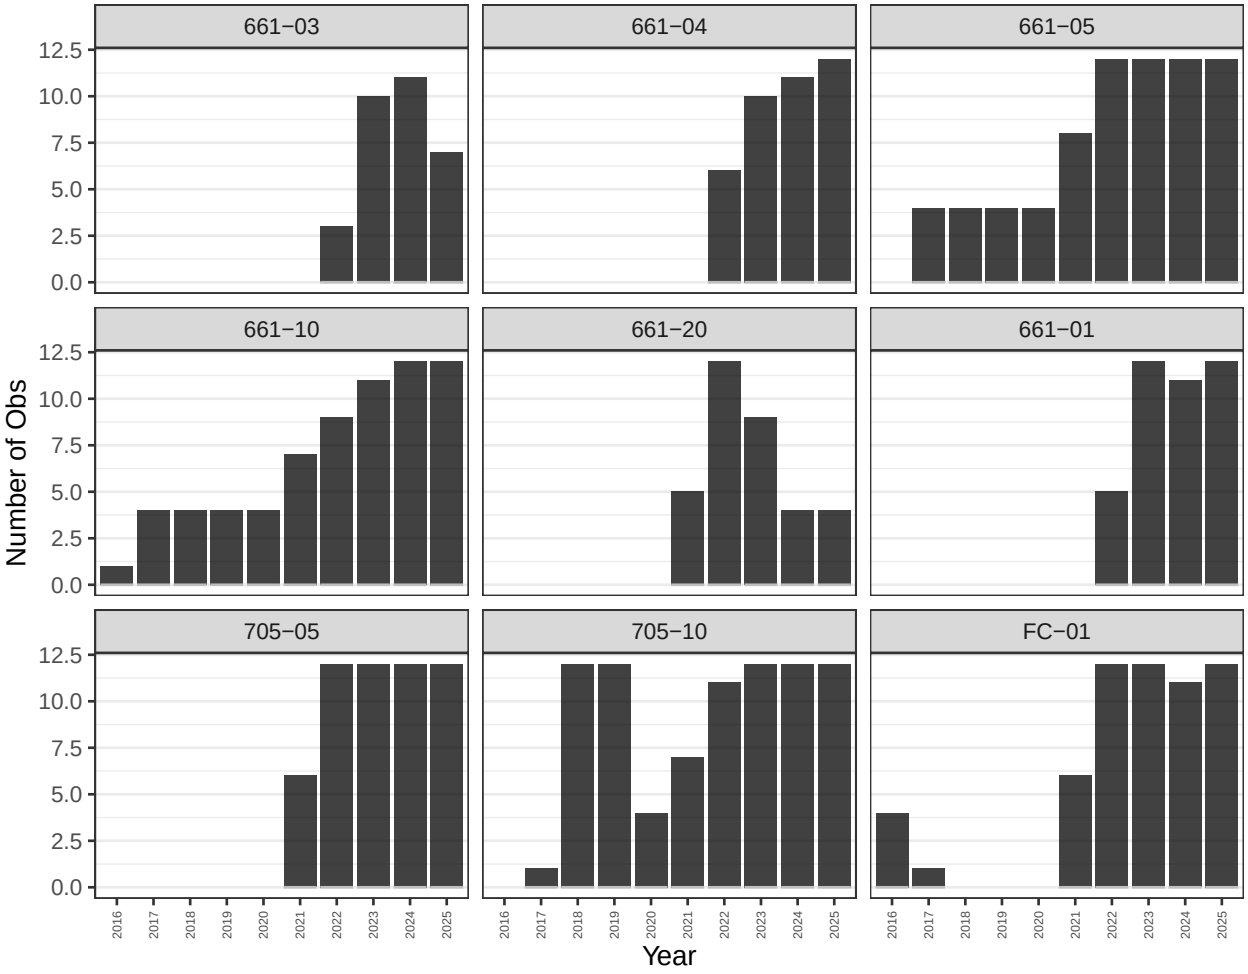
Variable	Total Zinc
Watershed	Creek 661
Waterbody	Stream
Streams Removed	All Excluded
Data Transformation	N/A
Model Type	N/A
Benchmark	None
Significant BACI term	N/A

A-12.2.32 Dissolved Aluminum

1 Creek 661

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

1.2 Sample Sizes for Modelling

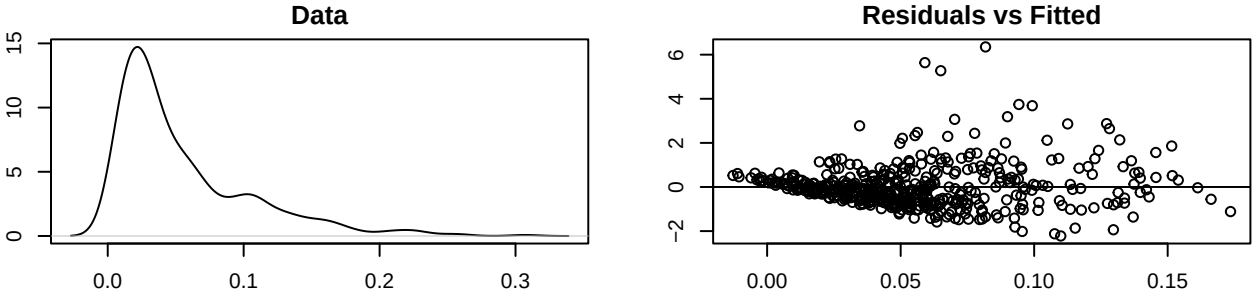
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Creek 661	661-03	before	2	0.0134	0
Creek 661	661-03	after	29	0.0505	0
Creek 661	661-04	before	3	0.1080	0
Creek 661	661-04	after	36	0.0253	0
Creek 661	661-05	before	33	0.0256	0
Creek 661	661-05	after	39	0.0203	0
Creek 661	661-10	before	31	0.0470	0
Creek 661	661-10	after	37	0.0511	0
Creek 661	661-20	before	14	0.0219	0
Creek 661	661-20	after	20	0.0116	0
Creek 661	661-01	before	3	0.0414	0
Creek 661	661-01	after	37	0.0471	0
Creek 705 (Control)	705-05	before	15	0.0641	0
Creek 705 (Control)	705-05	after	39	0.0437	0
Creek 705 (Control)	705-10	before	45	0.0675	0
Creek 705 (Control)	705-10	after	38	0.0445	0
Fawnie Creek (Control)	FC-01	before	20	0.0220	0
Fawnie Creek (Control)	FC-01	after	38	0.0100	0

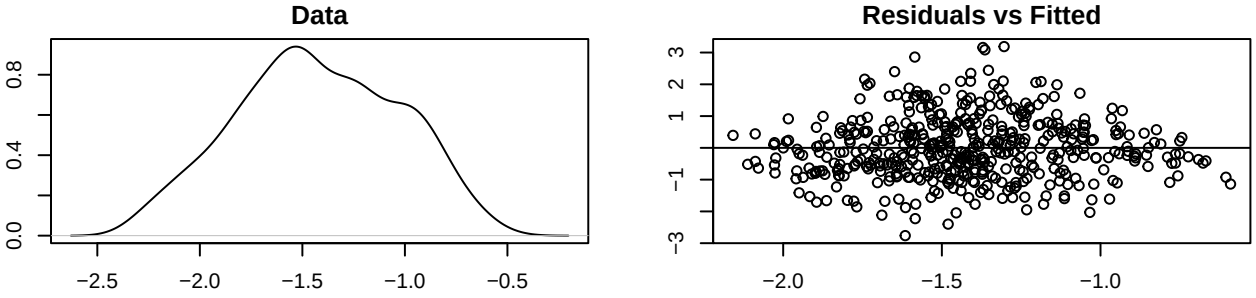
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-03	2025	4	impact	after	0.307	0.0818	6.350	Y
Creek 705 (Control)	705-05	2024	3	control	after	0.259	0.0591	5.637	Y
Creek 705 (Control)	705-10	2024	3	control	after	0.252	0.0650	5.272	Y
Creek 661	661-10	2019	11	impact	before	0.227	0.0943	3.742	Y
Creek 705 (Control)	705-10	2020	11	control	before	0.230	0.0993	3.686	Y
Creek 661	661-10	2025	4	impact	after	0.203	0.0900	3.186	Y
Creek 661	661-20	2022	6	impact	before	0.179	0.0702	3.067	Y

Outliers on log scale:

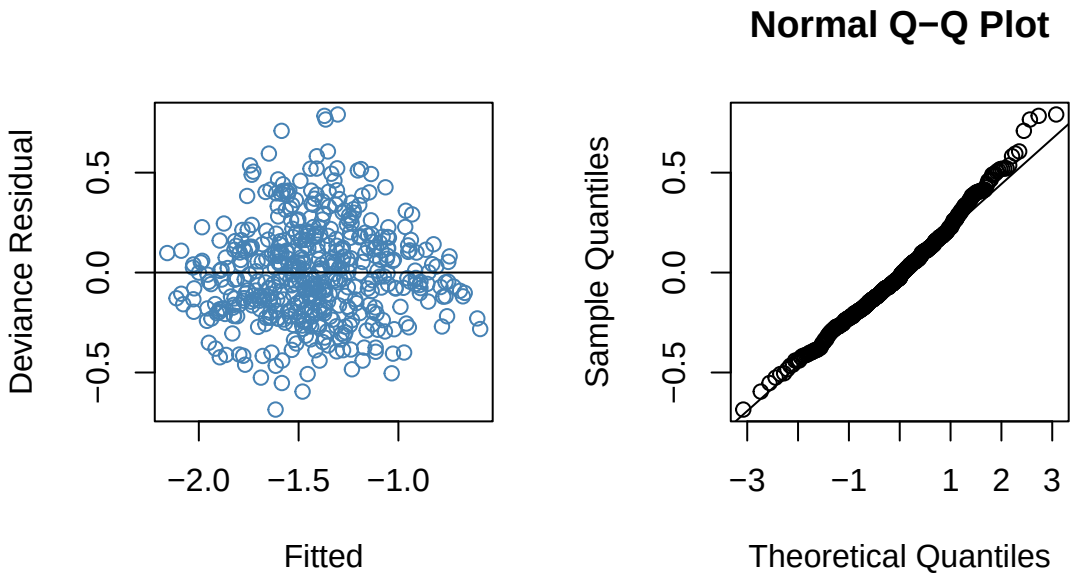
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-03	2025	4	impact	after	-0.5129	-1.304	3.187	Y
Creek 705 (Control)	705-05	2024	3	control	after	-0.5867	-1.371	3.159	Y
Creek 705 (Control)	705-10	2024	3	control	after	-0.5986	-1.364	3.085	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.03135	0.03135	1	7.047	0.509	0.499	
period	1.51498	1.51498	1	54.601	24.594	<0.001	
class:period	0.12316	0.12316	1	457.586	1.999	0.158	0.184

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
479	0.1294	65%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-03, 661-04, 661-05, 661-10, 661-20) and control sites (661-01, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

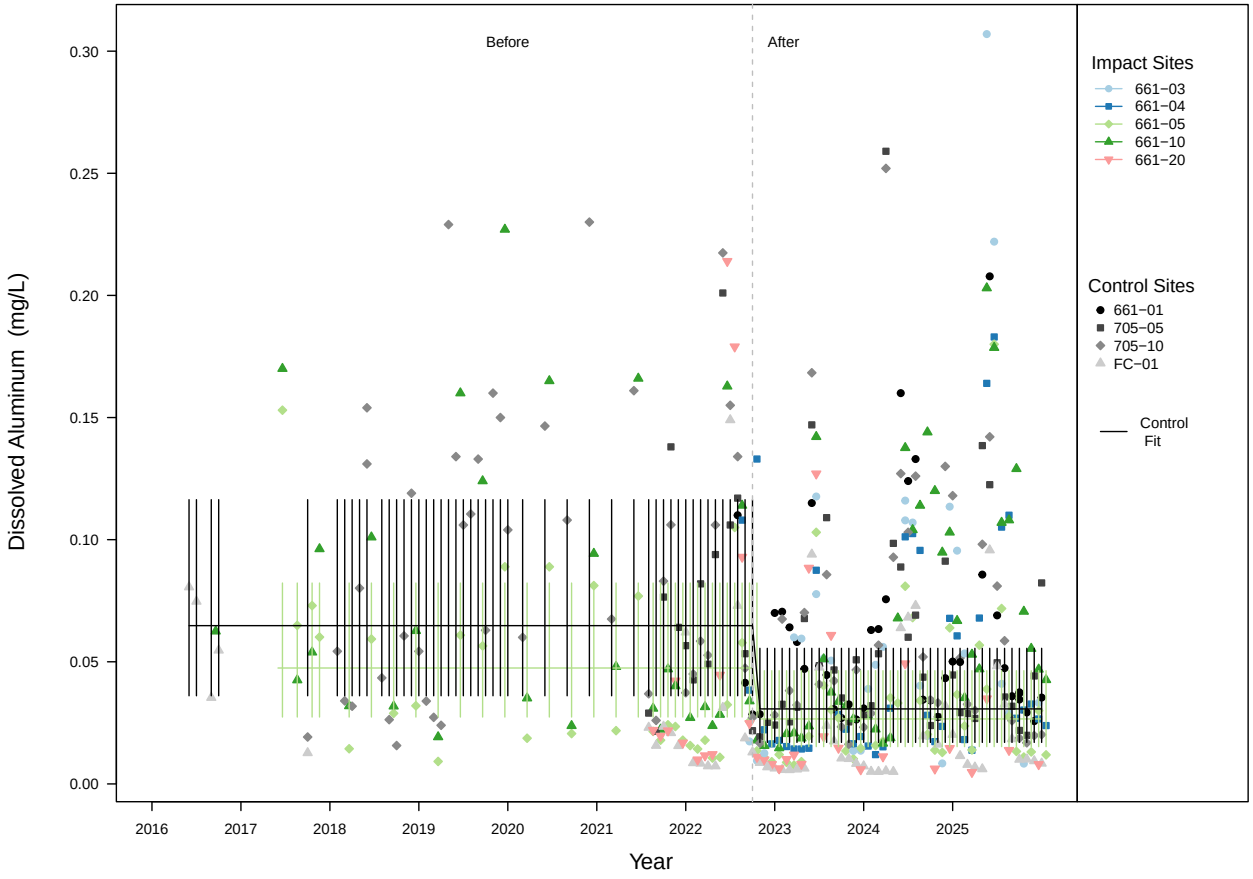
Impact vs.	Estimate	Significance
control sites	0.073	not significant

Conclusion:

The change in Dissolved Aluminum concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.184) different from the change at the control sites, according to the test on the BACI term (*class*:*period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

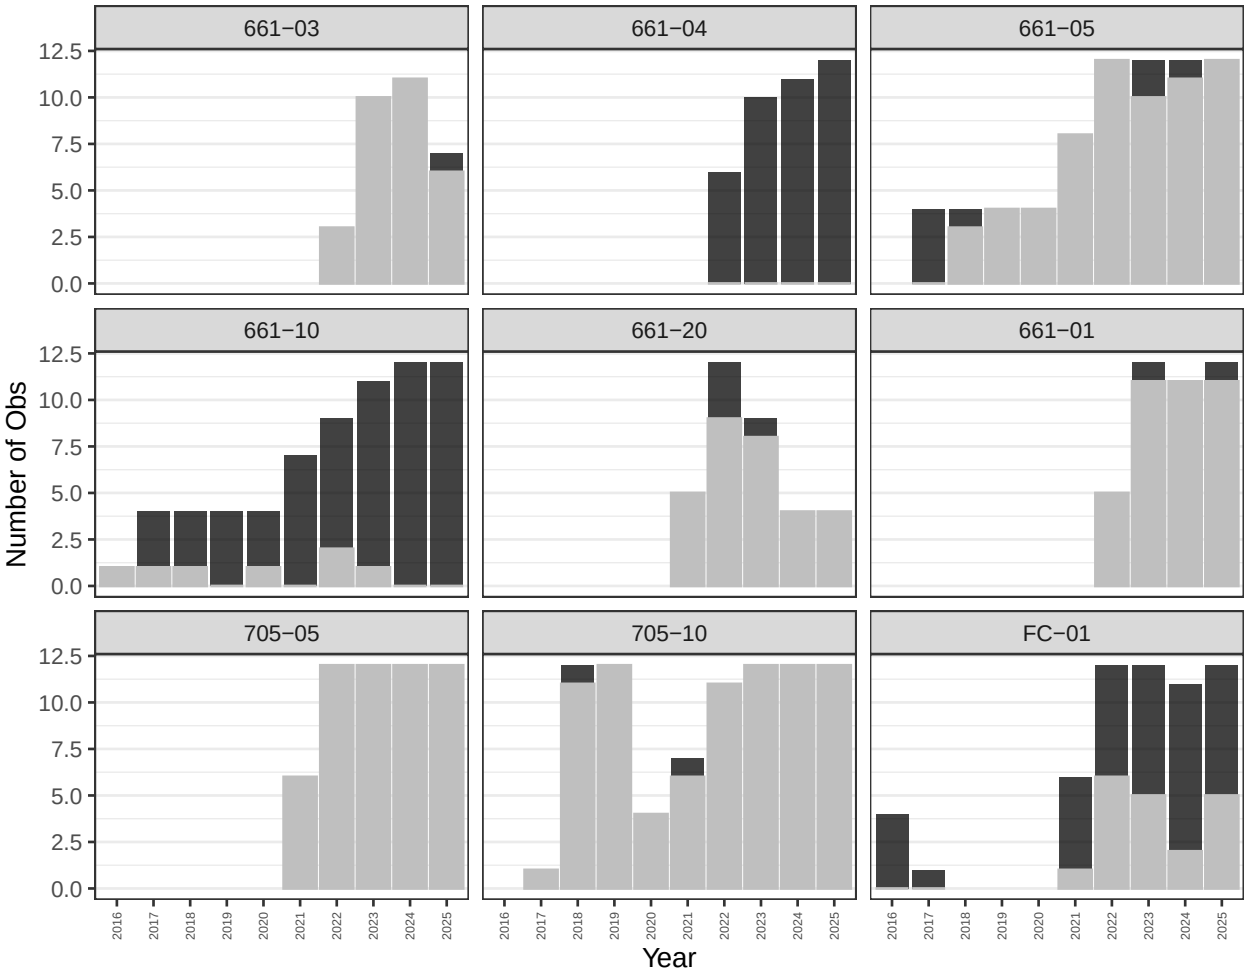
Final Summary Table

Variable	Dissolved Aluminum
Watershed	Creek 661
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

A-12.2.33 Dissolved Cadmium

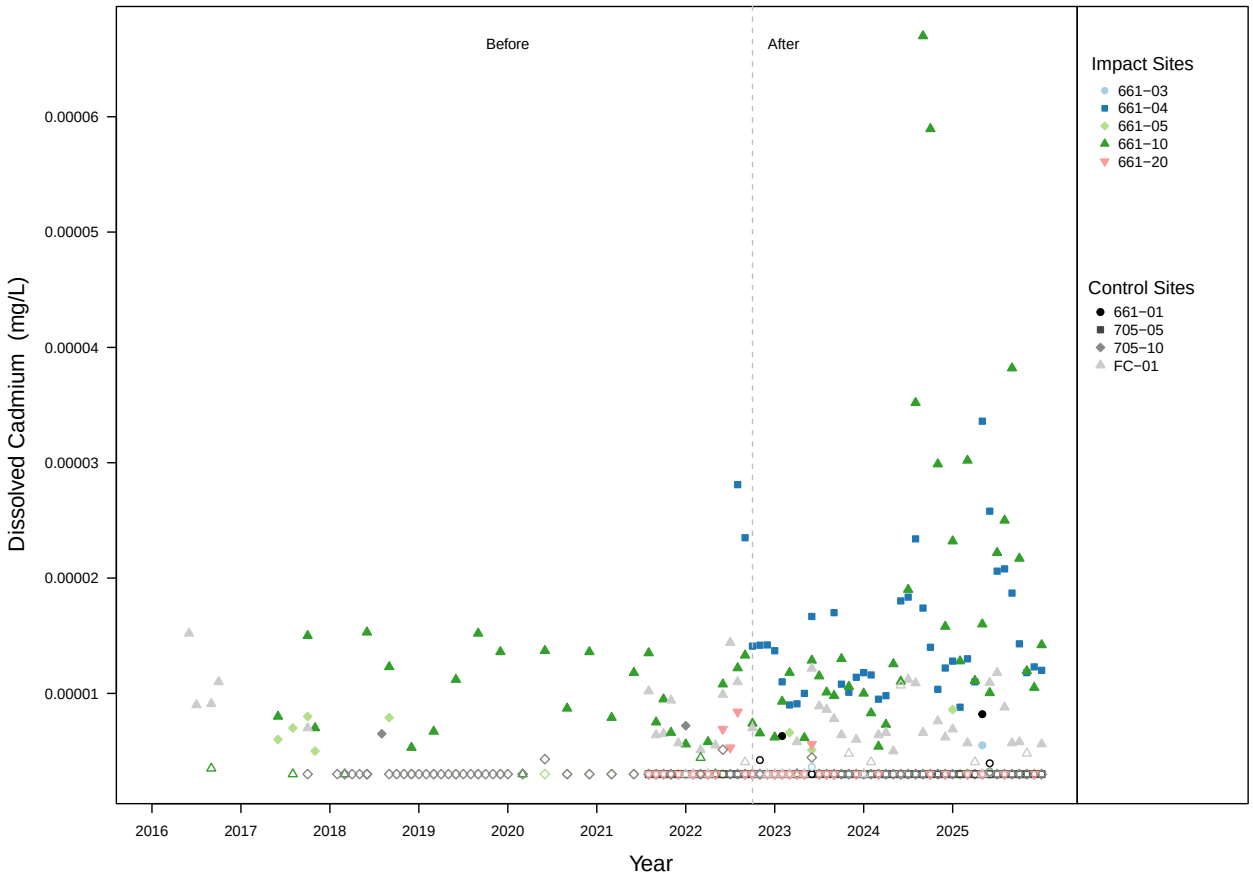
1 Creek 661

1.1 Censored Data The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Conclusion:

Statistical analyses were not conducted due to censoring or availability of observations. Below is a summary figure of all observations in the dataset.



Note: Open symbols represent cases where the results were below the sample detection limit.

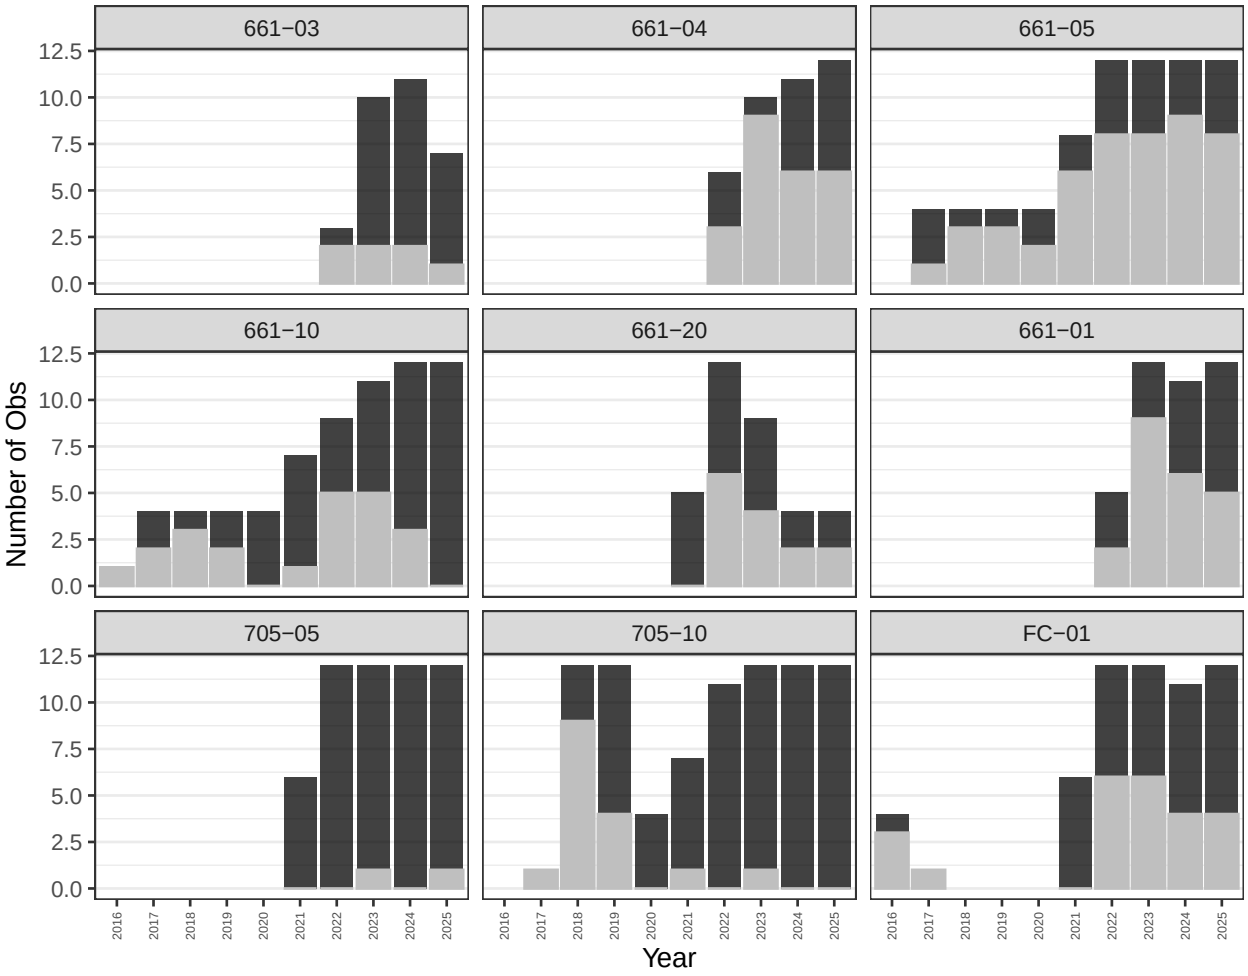
Final Summary Table

Variable	Dissolved Cadmium
Watershed	Creek 661
Waterbody	Stream
Streams Removed	All Excluded
Data Transformation	N/A
Model Type	N/A
Benchmark	None
Significant BACI term	N/A

A-12.2.34 Dissolved Copper

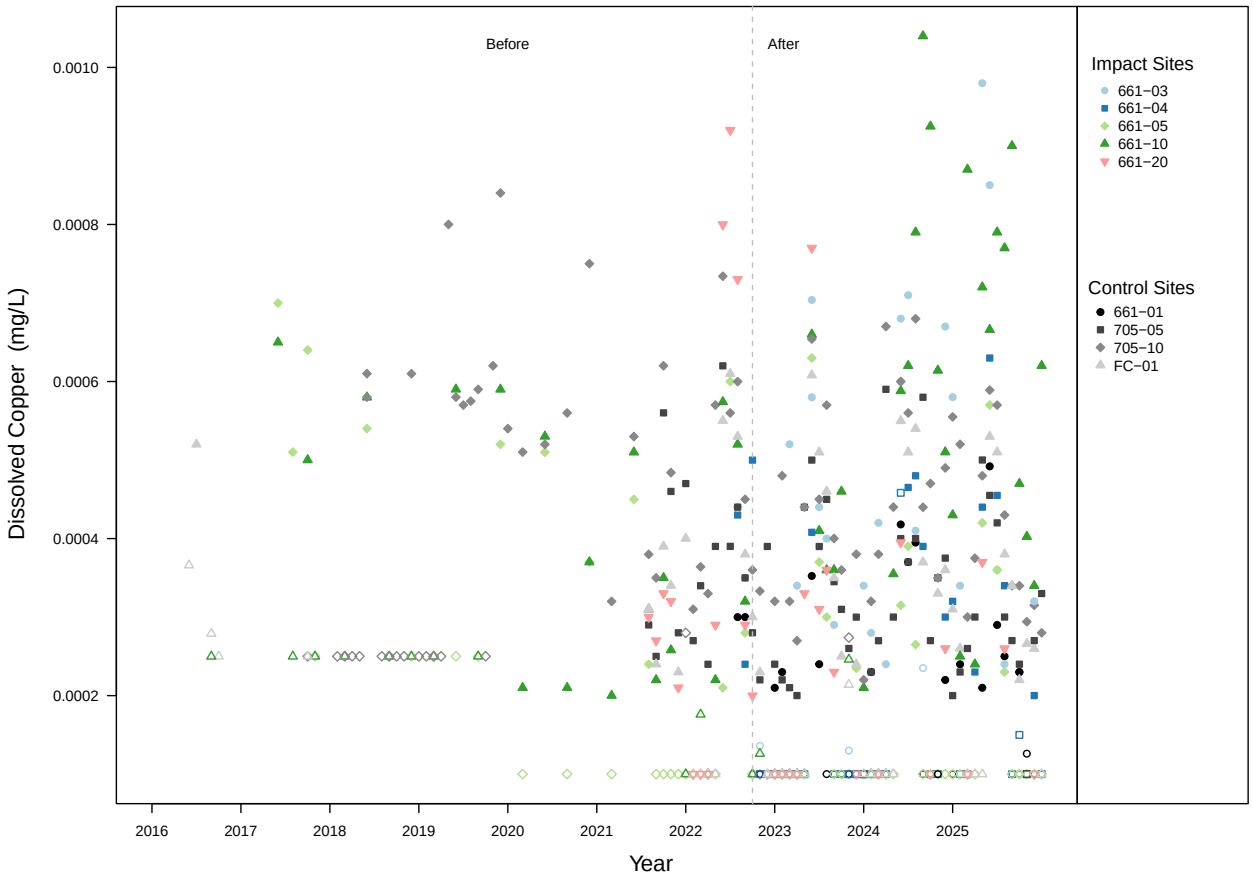
1 Creek 661

1.1 Censored Data The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Conclusion:

Statistical analyses were not conducted due to censoring or availability of observations. Below is a summary figure of all observations in the dataset.



Note: Open symbols represent cases where the results were below the sample detection limit.

Final Summary Table

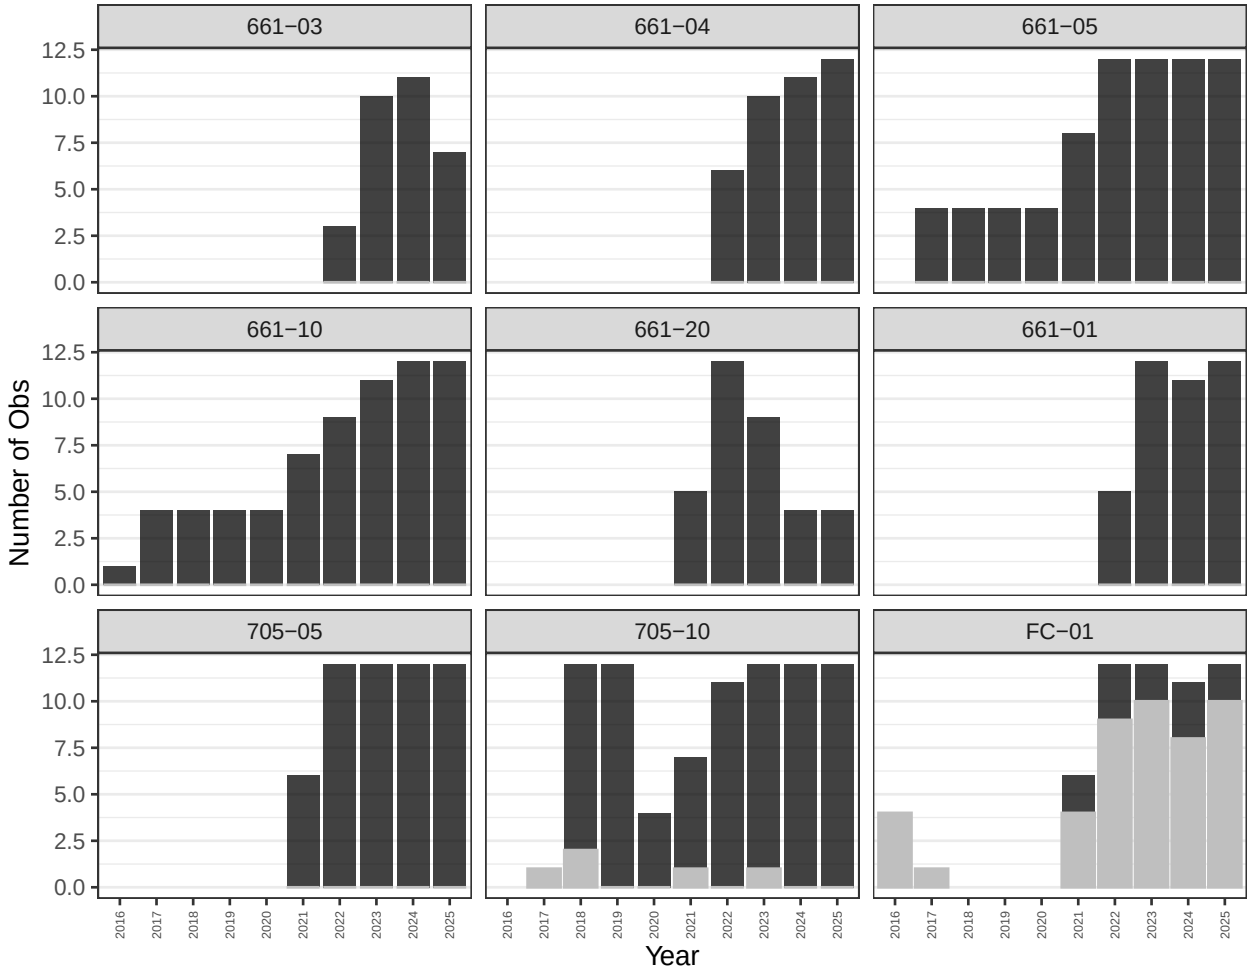
Variable	Dissolved Copper
Watershed	Creek 661
Waterbody	Stream
Streams Removed	All Excluded
Data Transformation	N/A
Model Type	N/A
Benchmark	None
Significant BACI term	N/A

A-12.2.35 Dissolved Iron

1 Creek 661

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

Watershed	Site	Year	Class	Period	#Obs Removed
Creek 705 (Control)	705-10	2017	control	before	1
Fawnie Creek (Control)	FC-01	2016	control	before	4
Fawnie Creek (Control)	FC-01	2017	control	before	1
Fawnie Creek (Control)	FC-01	2021	control	before	6
Fawnie Creek (Control)	FC-01	2022	control	before	12
Fawnie Creek (Control)	FC-01	2022	control	after	12
Fawnie Creek (Control)	FC-01	2023	control	after	12

(Continued on Next Page...)

(continued)

Watershed	Site	Year	Class	Period	#Obs Removed
Fawnie Creek (Control)	FC-01	2024	control	after	11
Fawnie Creek (Control)	FC-01	2025	control	after	12

1.2 Sample Sizes for Modelling

The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Creek 661	661-03	before	2	0.0590	0.000
Creek 661	661-03	after	29	0.0680	0.000
Creek 661	661-04	before	3	0.0500	0.000
Creek 661	661-04	after	36	0.0450	0.000
Creek 661	661-05	before	33	0.1230	0.000
Creek 661	661-05	after	39	0.0780	0.000
Creek 661	661-10	before	31	0.1400	0.000
Creek 661	661-10	after	37	0.1437	0.000
Creek 661	661-20	before	14	0.1470	0.000
Creek 661	661-20	after	20	0.0940	0.000
Creek 661	661-01	before	3	0.0670	0.000

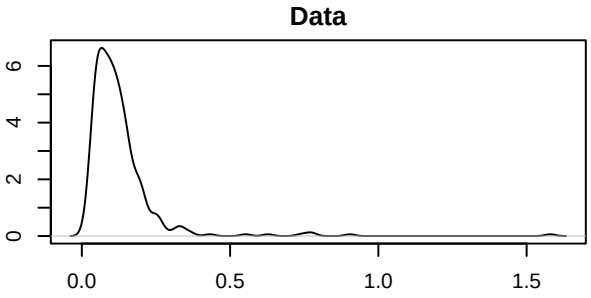
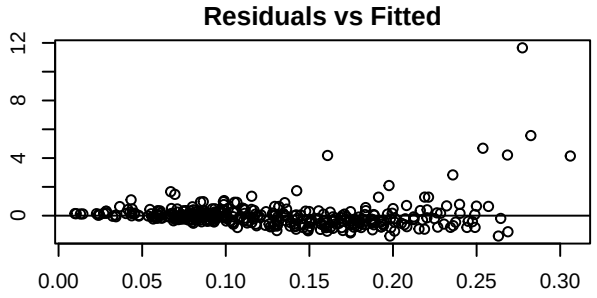
Creek 705 (Control)	705-05	before	15	0.1480	0.000
Creek 705 (Control)	705-05	after	39	0.1590	0.000
Creek 705 (Control)	705-10	before	28	0.0830	7.143

1.3 Initial Model Fit

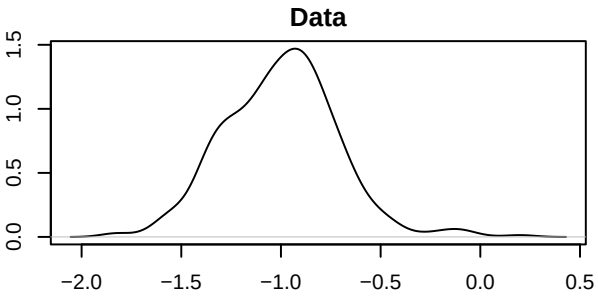
Initially a model was fit to all sites to assess the need for transformations.

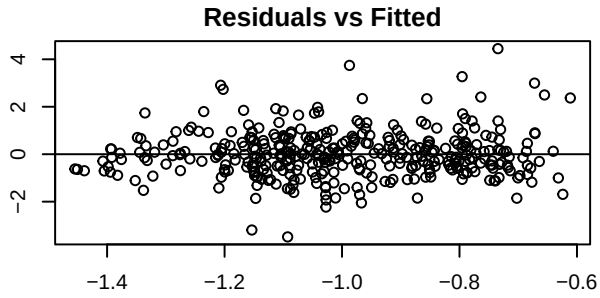
Natural Scale Model





Log−10 Transformed Model





Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-10	2025	8	impact	after	1.580	0.2774	11.658	Y
Creek 705 (Control)	705-05	2025	9	control	after	0.904	0.2824	5.563	Y
Creek 661	661-10	2025	9	impact	after	0.777	0.2538	4.683	Y
Creek 705 (Control)	705-05	2025	10	control	after	0.739	0.2685	4.211	Y
Creek 661	661-01	2025	4	control	after	0.628	0.1609	4.181	Y
Creek 705 (Control)	705-05	2025	8	control	after	0.769	0.3060	4.143	Y

Outliers on log scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-10	2025	8	impact	after	0.1987	-0.7346	4.448	Y
Creek 661	661-01	2025	4	control	after	-0.2020	-0.9873	3.743	Y
Creek 705 (Control)	705-10	2018	8	control	before	-1.8239	-1.0926	-3.486	N
Creek 661	661-10	2025	9	impact	after	-0.1096	-0.7955	3.269	Y

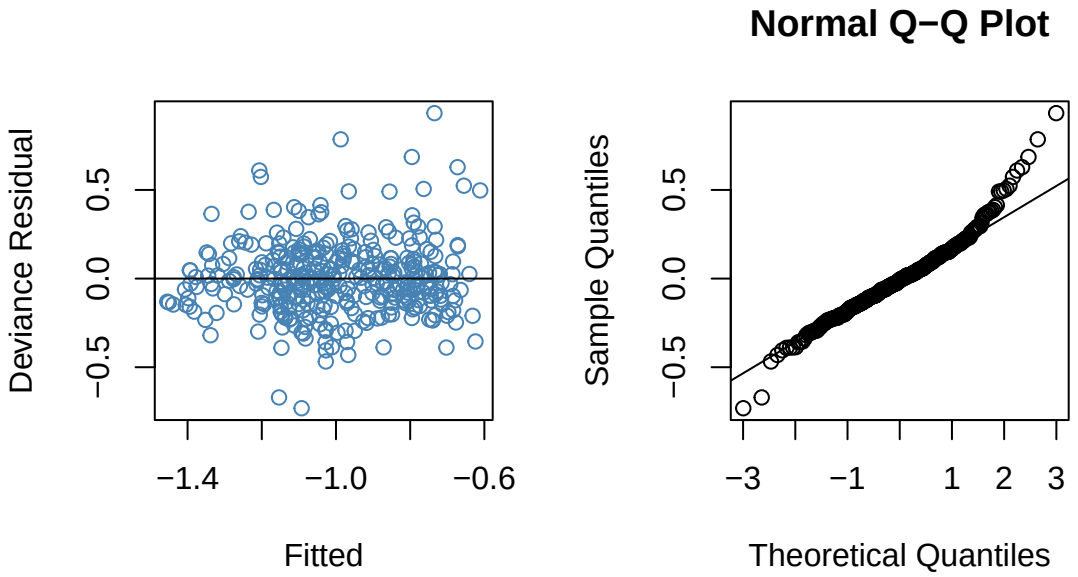
Creek 705 (Control)	705-10	2018	9	control	before	-1.8239	-1.1535	-3.195	N

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.002962	0.002962	1	5.95	0.0673	0.8040	
period	0.008778	0.008778	1	31.45	0.1994	0.6580	
class:period	0.224401	0.224401	1	344.20	5.0975	0.0246	0.0341

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
366	0.0271	7%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-03, 661-04, 661-05, 661-10, 661-20) and control sites (661-01, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

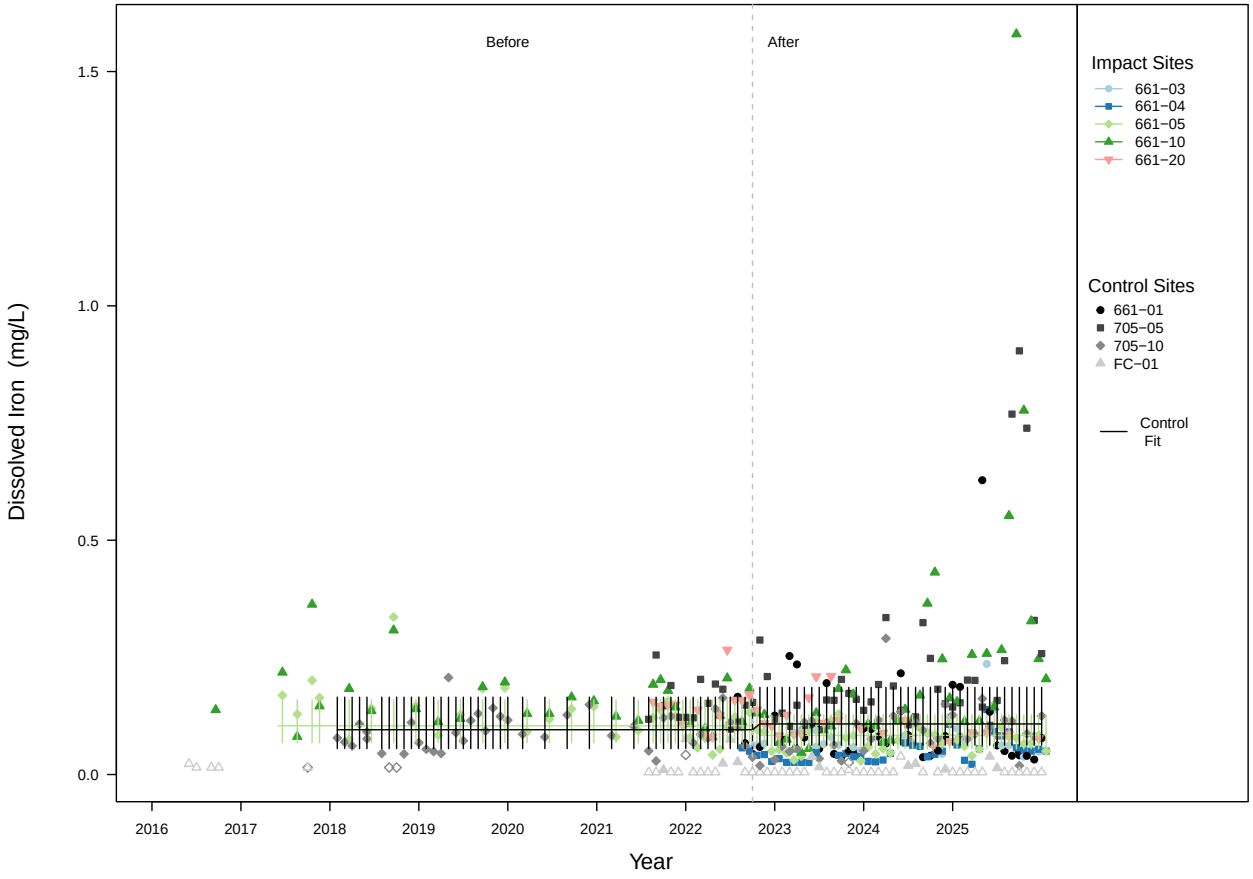
Impact vs.	Estimate	Significance
control sites	-0.148	significant

Conclusion:

The change in Dissolved Iron concentrations at the impact sites from *before* to *after* was significantly (*adjusted p =* 0.0341) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

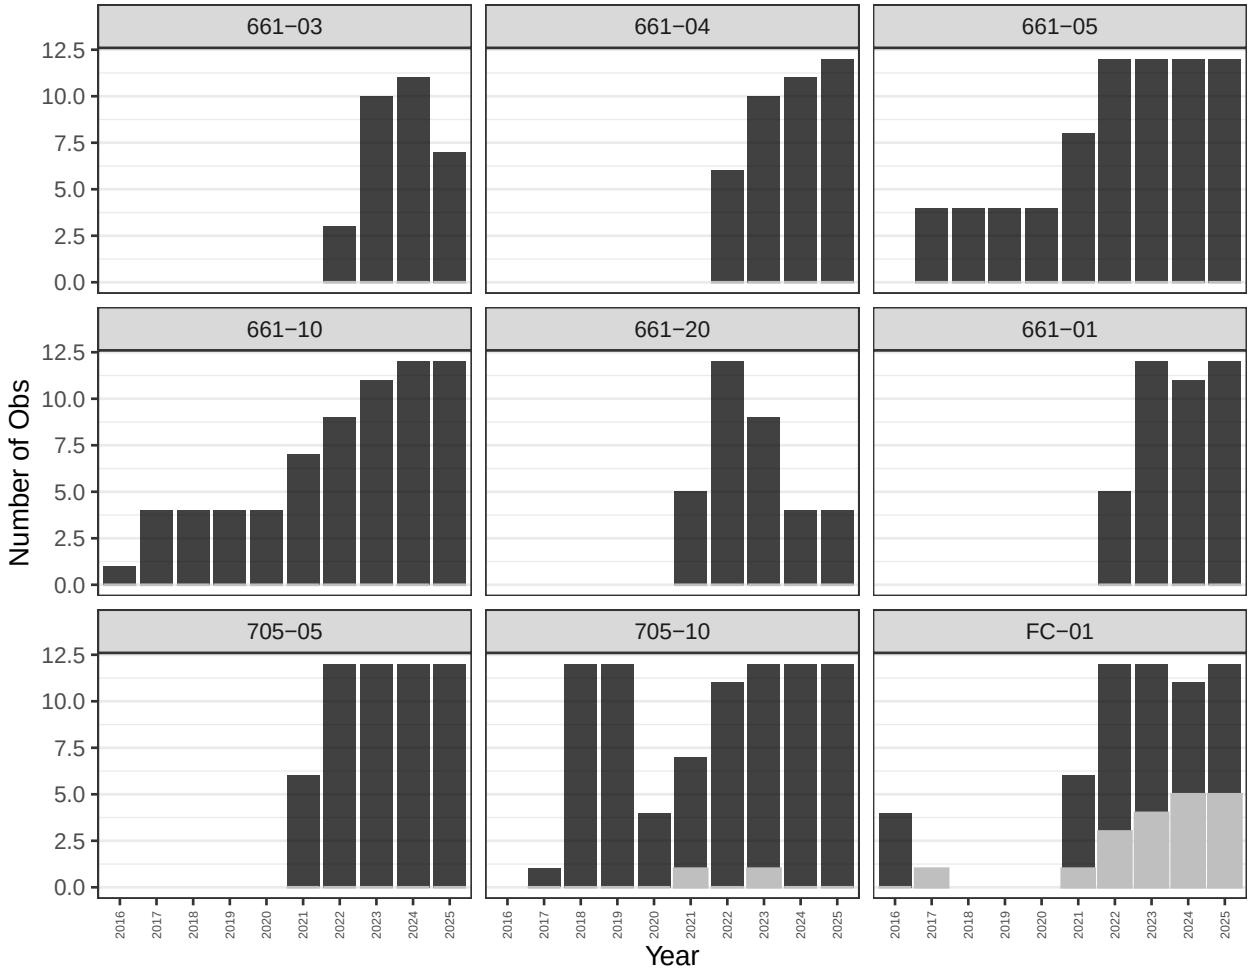
Variable	Dissolved Iron
Watershed	Creek 661
Waterbody	Stream
Streams Removed	FC-01
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	Yes

A-12.2.36 Dissolved Manganese

1 Creek 661

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

Watershed	Site	Year	Class	Period	#Obs Removed
Fawnie Creek (Control)	FC-01	2017	control	before	1

1.2 Sample Sizes for Modelling

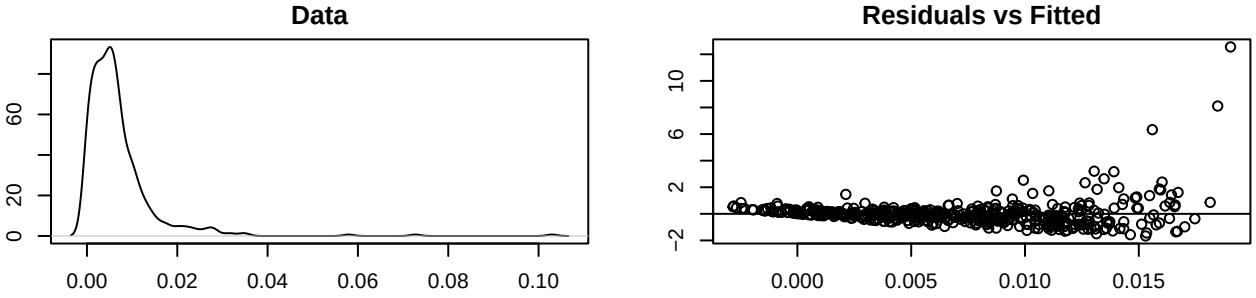
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Creek 661	661-03	before	2	0.0186	0.000
Creek 661	661-03	after	29	0.0105	0.000
Creek 661	661-04	before	3	0.0044	0.000
Creek 661	661-04	after	36	0.0052	0.000
Creek 661	661-05	before	33	0.0058	0.000
Creek 661	661-05	after	39	0.0057	0.000
Creek 661	661-10	before	31	0.0087	0.000
Creek 661	661-10	after	37	0.0075	0.000
Creek 661	661-20	before	14	0.0053	0.000
Creek 661	661-20	after	20	0.0042	0.000
Creek 661	661-01	before	3	0.0123	0.000
Creek 661	661-01	after	37	0.0096	0.000
Creek 705 (Control)	705-05	before	15	0.0071	0.000
Creek 705 (Control)	705-05	after	39	0.0091	0.000
Creek 705 (Control)	705-10	before	45	0.0020	2.222
Creek 705 (Control)	705-10	after	38	0.0019	2.632
Fawnie Creek (Control)	FC-01	before	19	0.0002	15.790
Fawnie Creek (Control)	FC-01	after	38	0.0001	39.474

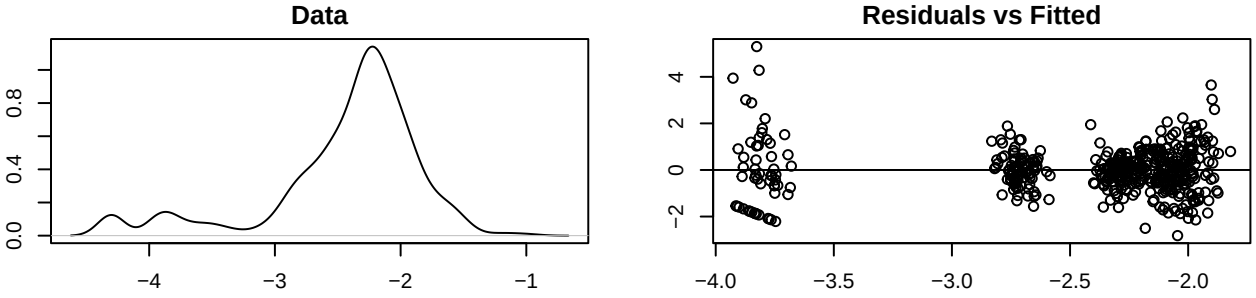
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 705 (Control)	705-05	2025	10	control	after	0.1030	0.0190	12.552	Y
Creek 705 (Control)	705-05	2025	8	control	after	0.0727	0.0185	8.107	Y
Creek 661	661-03	2024	8	impact	after	0.0580	0.0156	6.332	Y
Creek 661	661-10	2025	2	impact	after	0.0345	0.0130	3.208	Y
Creek 661	661-10	2025	9	impact	after	0.0351	0.0139	3.168	Y

Outliers on log scale:

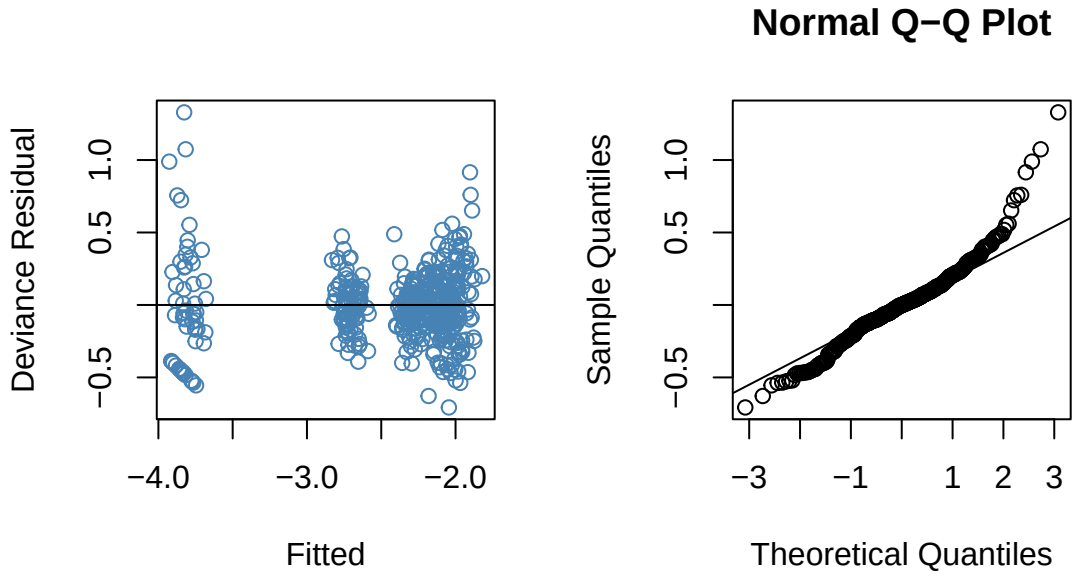
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Fawnie Creek (Control)	FC-01	2022	6	control	before	-2.4976	-3.826	5.298	Y
Fawnie Creek (Control)	FC-01	2021	12	control	before	-2.7423	-3.816	4.282	Y
Fawnie Creek (Control)	FC-01	2023	5	control	after	-2.9378	-3.927	3.942	Y
Creek 705 (Control)	705-05	2025	10	control	after	-0.9872	-1.902	3.649	Y
Creek 705 (Control)	705-05	2025	8	control	after	-1.1385	-1.898	3.029	Y
Fawnie Creek (Control)	FC-01	2024	5	control	after	-3.1169	-3.873	3.013	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.099550	0.099550	1	7.007	1.5822	0.249	
period	0.003109	0.003109	1	16.374	0.0494	0.827	
class:period	0.035473	0.035473	1	458.121	0.5638	0.453	0.475

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
478	0.1514	80%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-03, 661-04, 661-05, 661-10, 661-20) and control sites (661-01, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

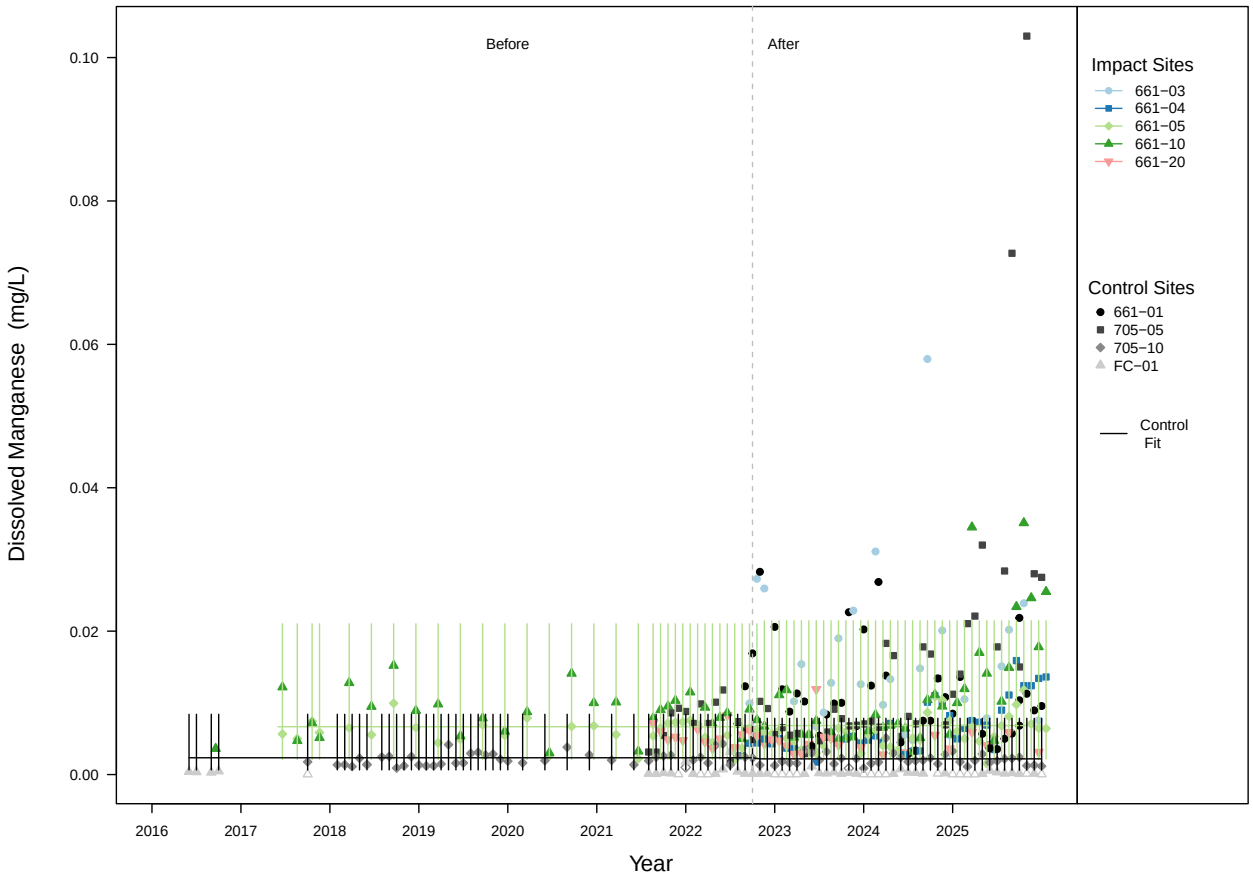
Impact vs.	Estimate	Significance
control sites	0.0391	not significant

Conclusion:

The change in Dissolved Manganese concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.475) different from the change at the control sites, according to the test on the BACI term (*class*:*period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

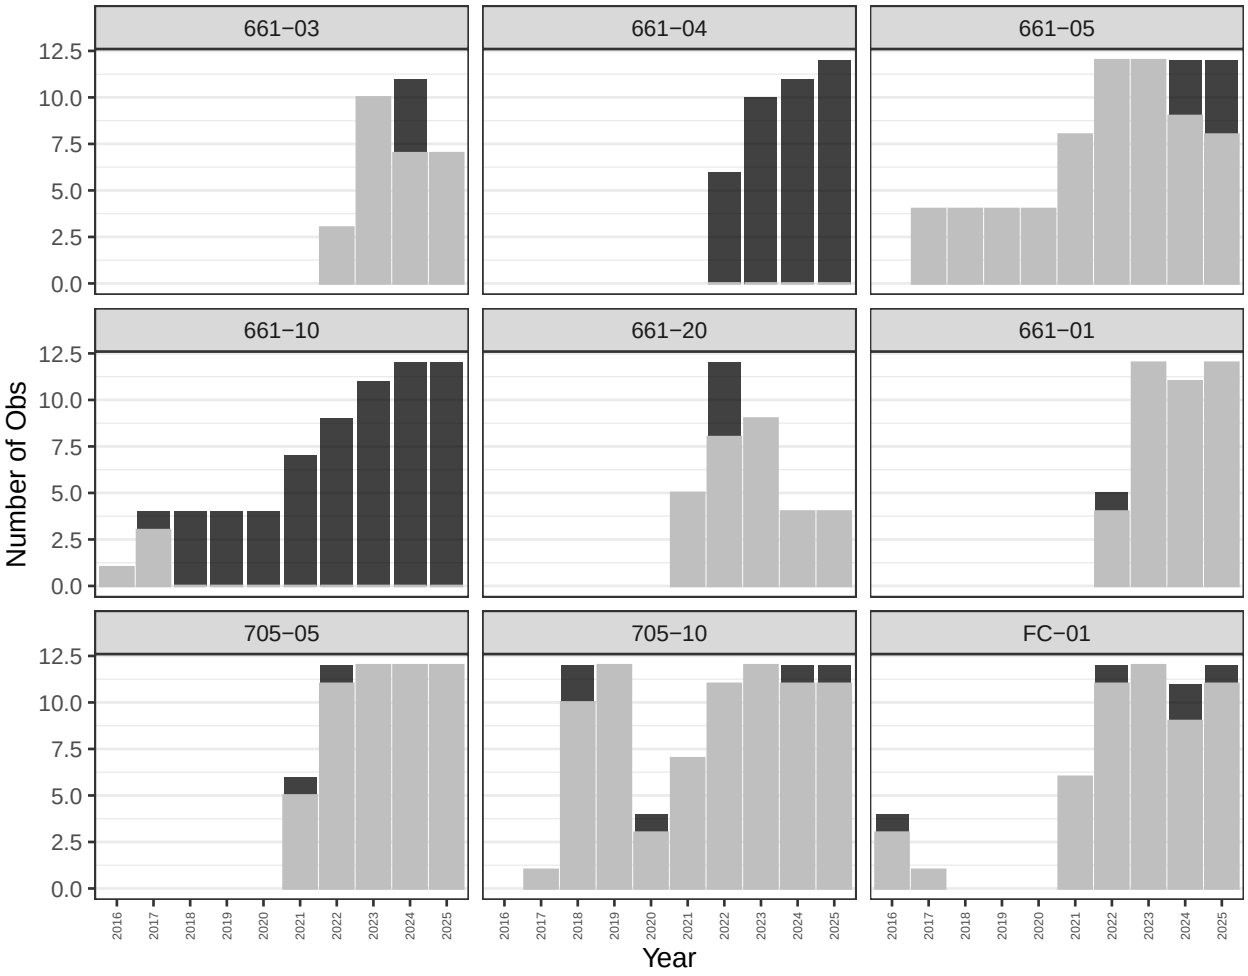
Final Summary Table

Variable	Dissolved Manganese
Watershed	Creek 661
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

A-12.2.37 Dissolved Zinc

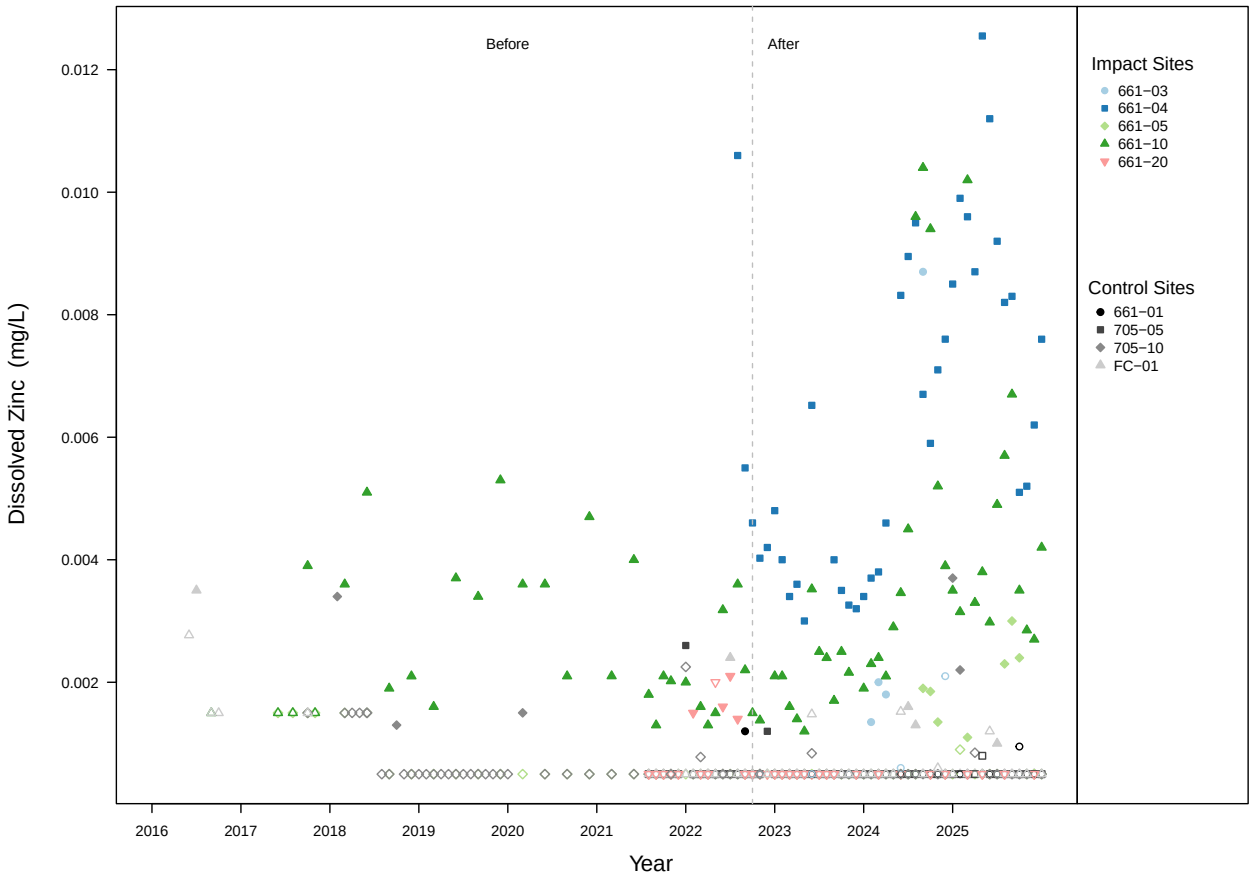
1 Creek 661

1.1 Censored Data The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Conclusion:

Statistical analyses were not conducted due to censoring or availability of observations. Below is a summary figure of all observations in the dataset.



Note: Open symbols represent cases where the results were below the sample detection limit.

Final Summary Table

Variable	Dissolved Zinc
Watershed	Creek 661
Waterbody	Stream
Streams Removed	All Excluded
Data Transformation	N/A
Model Type	N/A
Benchmark	None
Significant BACI term	N/A

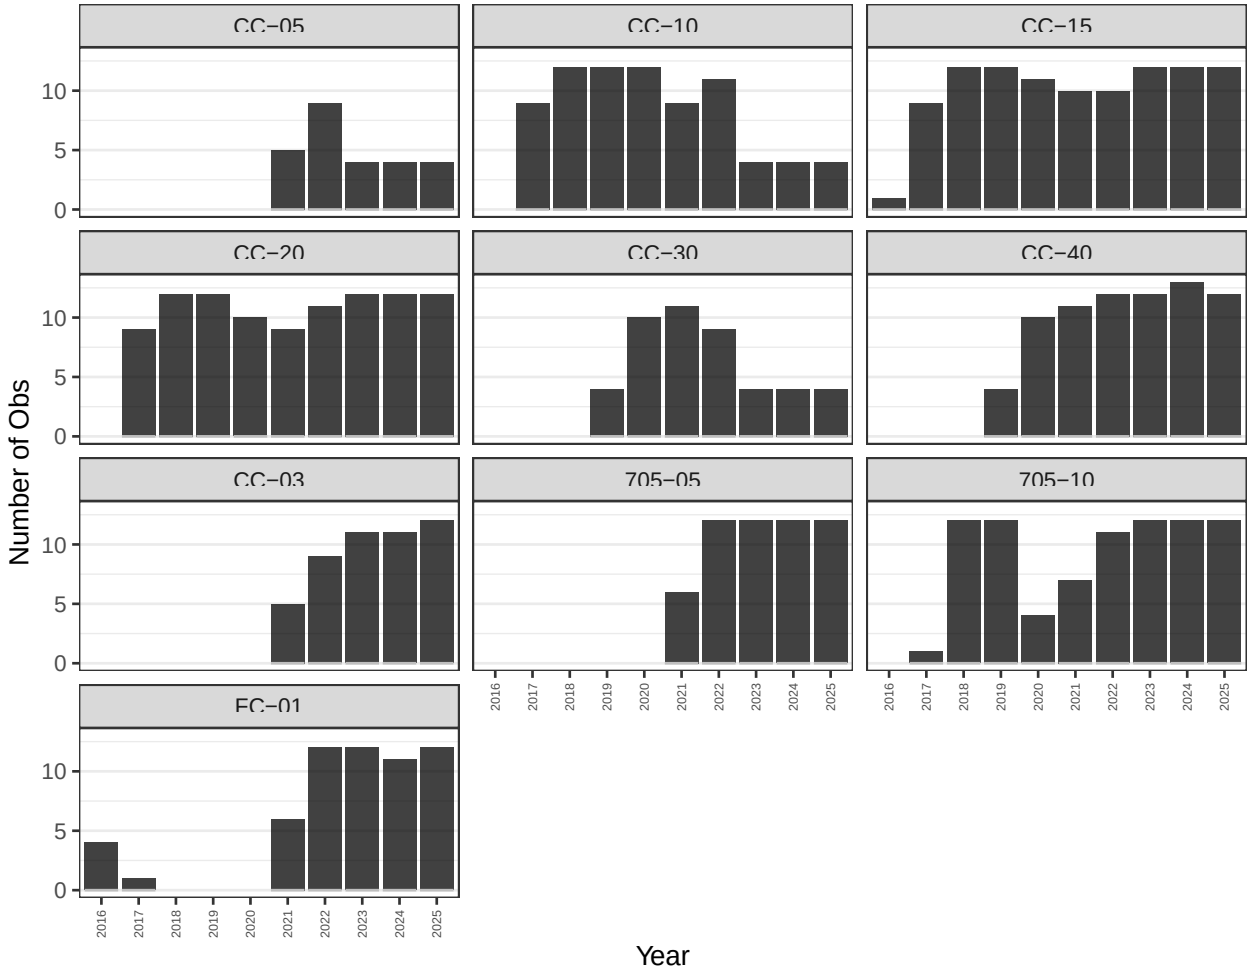
A-12.3 Chedakuz Creek

A-12.3.1 pH

1 Chedakuz Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

1.2 Sample Sizes for Modelling

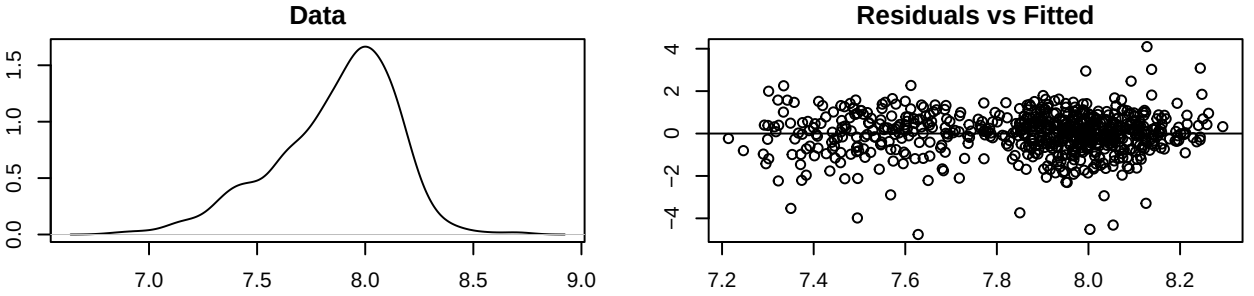
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Chedakuz Creek	CC-05	before	12	8.060	0
Chedakuz Creek	CC-05	after	14	8.148	0
Chedakuz Creek	CC-10	before	62	8.040	0
Chedakuz Creek	CC-10	after	15	8.020	0
Chedakuz Creek	CC-15	before	63	7.970	0
Chedakuz Creek	CC-15	after	38	7.980	0
Chedakuz Creek	CC-20	before	61	7.960	0
Chedakuz Creek	CC-20	after	38	7.990	0
Chedakuz Creek	CC-30	before	30	7.894	0
Chedakuz Creek	CC-30	after	16	8.085	0
Chedakuz Creek	CC-40	before	34	7.890	0
Chedakuz Creek	CC-40	after	40	8.055	0
Chedakuz Creek	CC-03	before	12	8.115	0
Chedakuz Creek	CC-03	after	36	8.213	0
Creek 705 (Control)	705-05	before	15	7.390	0
Creek 705 (Control)	705-05	after	39	7.410	0
Creek 705 (Control)	705-10	before	45	7.600	0
Creek 705 (Control)	705-10	after	38	7.593	0
Fawnie Creek (Control)	FC-01	before	20	7.665	0
Fawnie Creek (Control)	FC-01	after	38	7.720	0

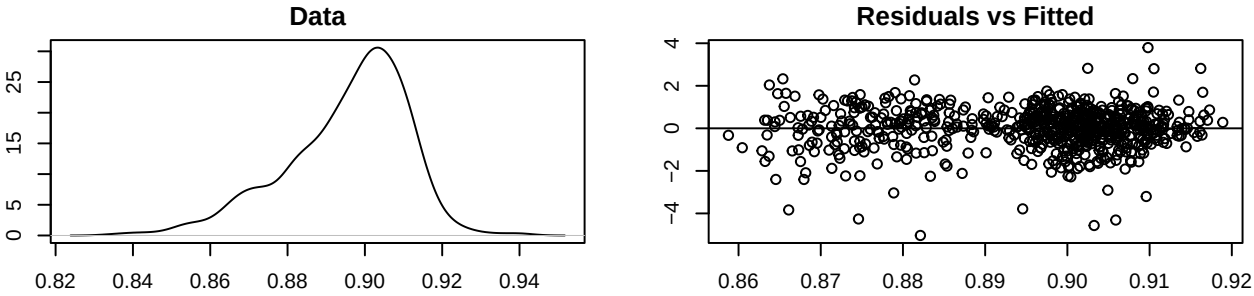
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Fawnie Creek (Control)	FC-01	2023	7	control	after	6.940	7.628	-4.761	Y
Chedakuz Creek	CC-40	2021	9	impact	before	7.350	8.003	-4.520	Y
Chedakuz Creek	CC-10	2024	11	impact	after	7.430	8.054	-4.317	Y
Chedakuz Creek	CC-10	2020	8	impact	before	8.720	8.128	4.097	Y
Creek 705 (Control)	705-10	2023	7	control	after	6.920	7.495	-3.982	Y
Chedakuz Creek	CC-15	2020	6	impact	before	7.310	7.850	-3.738	Y
Creek 705 (Control)	705-05	2023	7	control	after	6.840	7.350	-3.530	Y
Chedakuz Creek	CC-03	2024	6	control	after	7.650	8.126	-3.291	Y
Chedakuz Creek	CC-10	2025	8	impact	after	8.690	8.244	3.084	Y
Chedakuz Creek	CC-15	2025	8	impact	after	8.575	8.138	3.024	Y

Outliers on log scale:

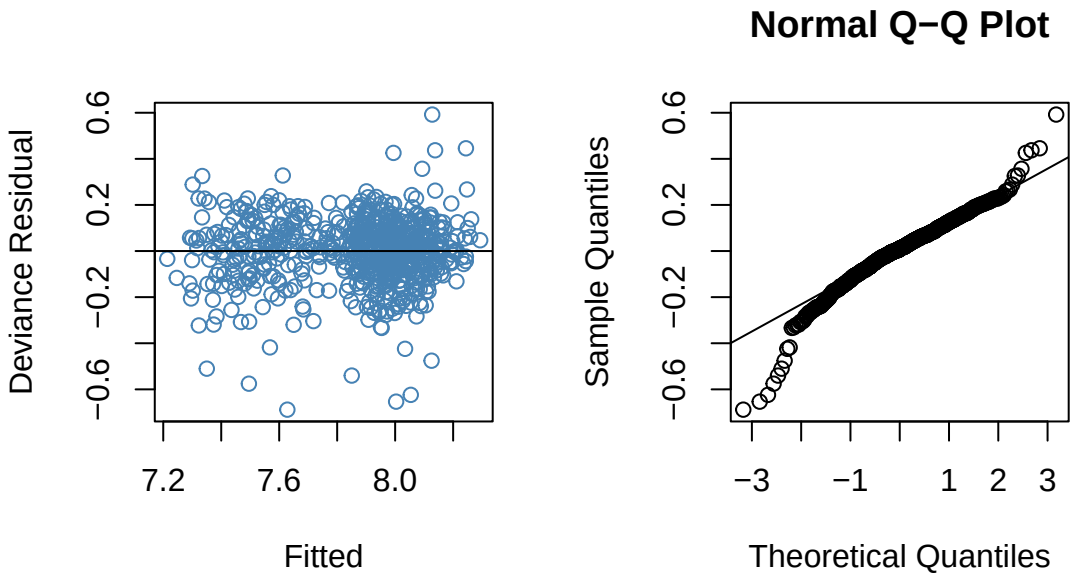
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Fawnie Creek (Control)	FC-01	2023	7	control	after	0.8414	0.8821	-5.036	Y
Chedakuz Creek	CC-40	2021	9	impact	before	0.8663	0.9033	-4.567	Y
Chedakuz Creek	CC-10	2024	11	impact	after	0.8710	0.9059	-4.312	Y
Creek 705 (Control)	705-10	2023	7	control	after	0.8401	0.8746	-4.261	Y
Creek 705 (Control)	705-05	2023	7	control	after	0.8351	0.8661	-3.836	Y
Chedakuz Creek	CC-10	2020	8	impact	before	0.9405	0.9098	3.795	Y
Chedakuz Creek	CC-15	2020	6	impact	before	0.8639	0.8946	-3.786	Y
Chedakuz Creek	CC-03	2024	6	control	after	0.8837	0.9096	-3.204	Y
Fawnie Creek (Control)	FC-01	2022	6	control	before	0.8543	0.8789	-3.036	Y

Based on examination of the residuals, the untransformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.12088	0.12088	1	8.011	5.787	0.0428	
period	0.08513	0.08513	1	45.957	4.075	0.0494	
class:period	0.07726	0.07726	1	644.295	3.699	0.0549	0.0731

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
666	0.3177	100%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (CC-05, CC-10, CC-15, CC-20, CC-30, CC-40) and control sites (CC-03, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

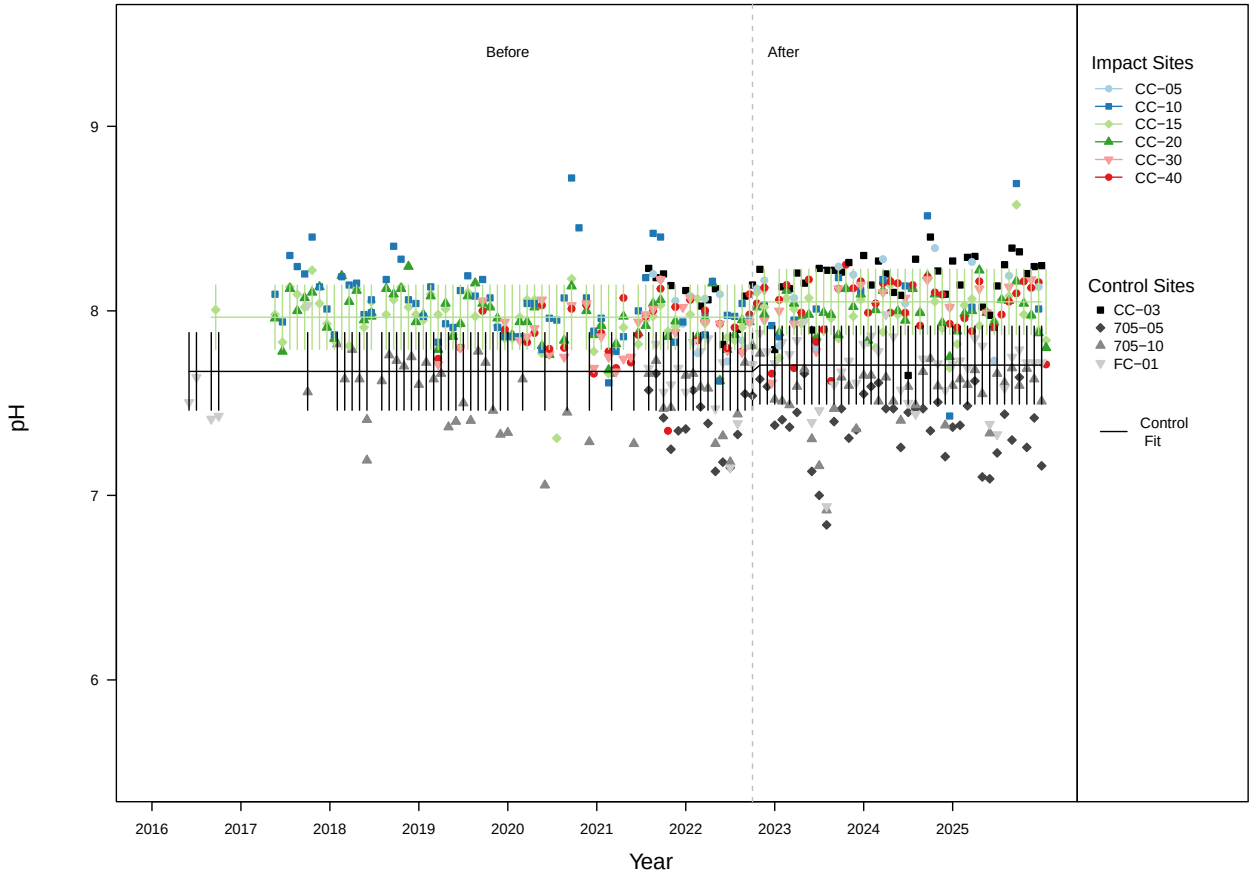
Impact vs.	Estimate	Significance
control sites	0.0492	not significant

Conclusion:

The change in pH at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.0731) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility.

Final Summary Table

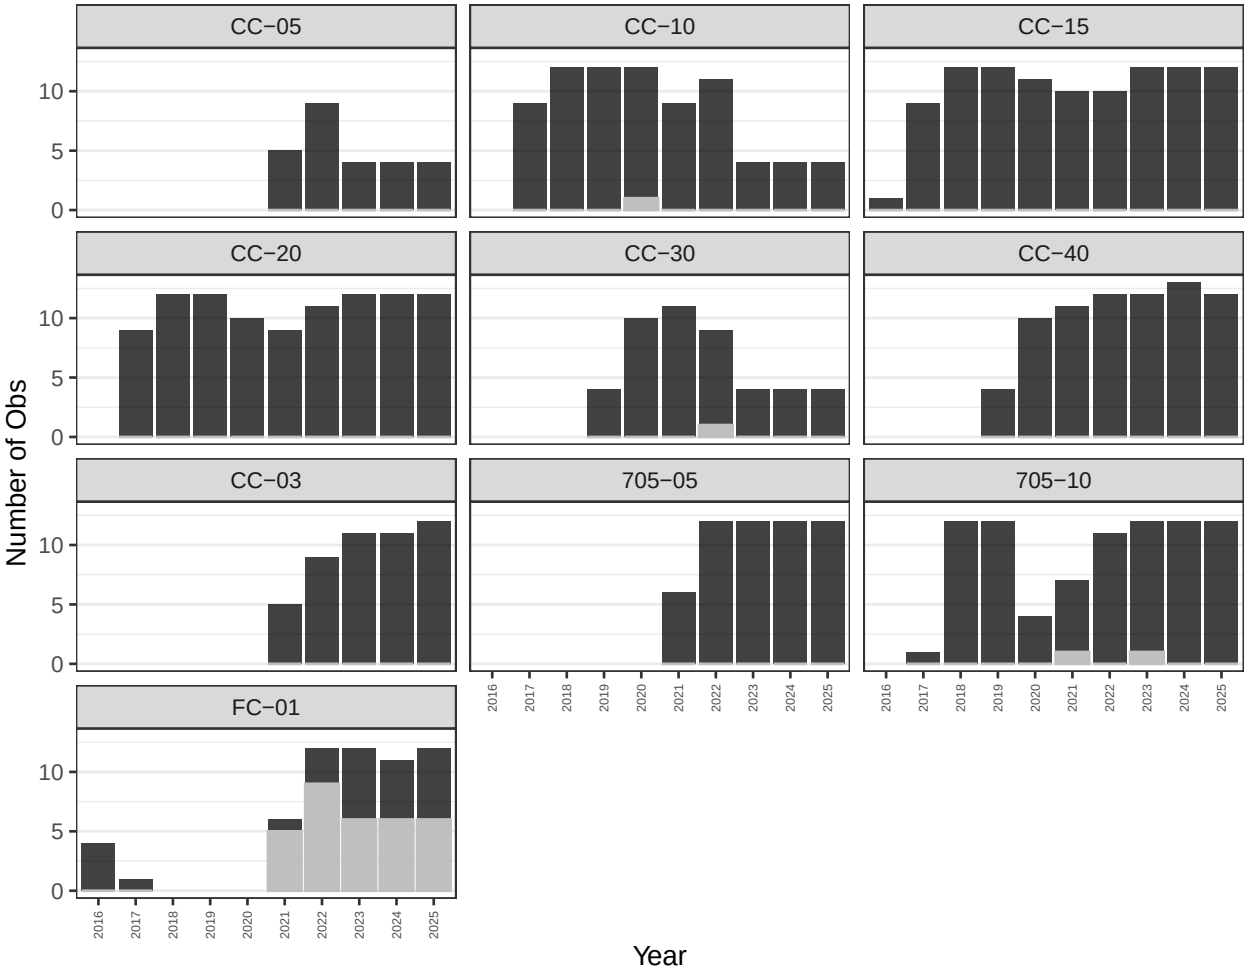
Variable	pH
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	None
Data Transformation	Untransformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

A-12.3.2 Turbidity

1 Chedakuz Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

Watershed	Site	Year	Class	Period	#Obs Removed
Fawnie Creek (Control)	FC-01	2021	control	before	6
Fawnie Creek (Control)	FC-01	2022	control	before	12
Fawnie Creek (Control)	FC-01	2022	control	after	12
Fawnie Creek (Control)	FC-01	2024	control	after	11

1.2 Sample Sizes for Modelling

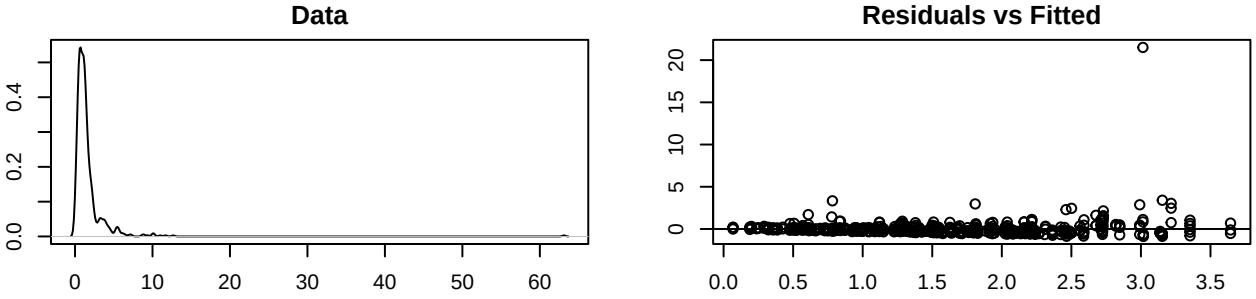
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Chedakuz Creek	CC-05	before	12	1.5800	0.000
Chedakuz Creek	CC-05	after	14	0.7950	0.000
Chedakuz Creek	CC-10	before	62	0.6675	1.613
Chedakuz Creek	CC-10	after	15	0.8900	0.000
Chedakuz Creek	CC-15	before	63	1.1700	0.000
Chedakuz Creek	CC-15	after	38	1.9425	0.000
Chedakuz Creek	CC-20	before	61	1.1100	0.000
Chedakuz Creek	CC-20	after	38	1.5750	0.000
Chedakuz Creek	CC-30	before	30	1.4000	3.333
Chedakuz Creek	CC-30	after	16	1.4745	0.000
Chedakuz Creek	CC-40	before	34	1.4025	0.000
Chedakuz Creek	CC-40	after	40	1.5325	0.000
Chedakuz Creek	CC-03	before	12	1.5435	0.000
Chedakuz Creek	CC-03	after	36	0.7800	0.000
Creek 705 (Control)	705-05	before	15	0.7400	0.000
Creek 705 (Control)	705-05	after	39	0.8050	0.000
Creek 705 (Control)	705-10	before	45	0.6000	2.222
Creek 705 (Control)	705-10	after	38	0.5450	2.632
Fawnie Creek (Control)	FC-01	before	5	0.2200	0.000
Fawnie Creek (Control)	FC-01	after	24	0.1150	50.000

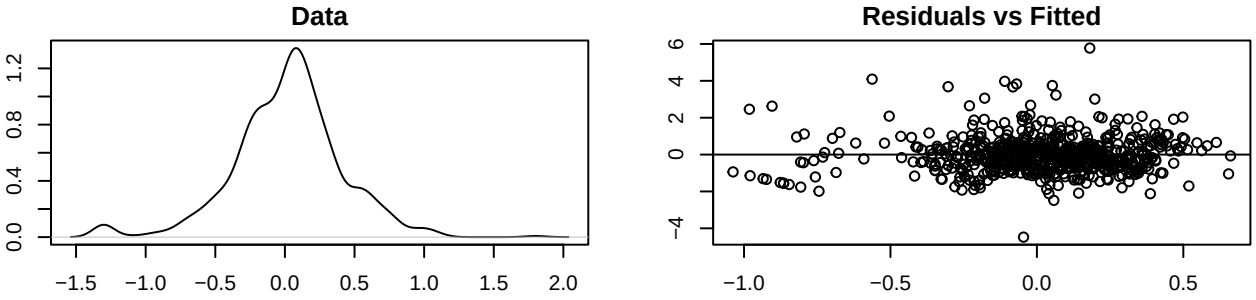
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-20	2018	10	impact	before	63.10	3.0144	21.503	Y
Chedakuz Creek	CC-10	2022	10	impact	after	12.67	3.1540	3.405	Y
Creek 705 (Control)	705-05	2025	12	control	after	10.10	0.7825	3.334	Y
Chedakuz Creek	CC-15	2024	4	impact	after	11.70	3.2173	3.036	Y

Outliers on log scale:

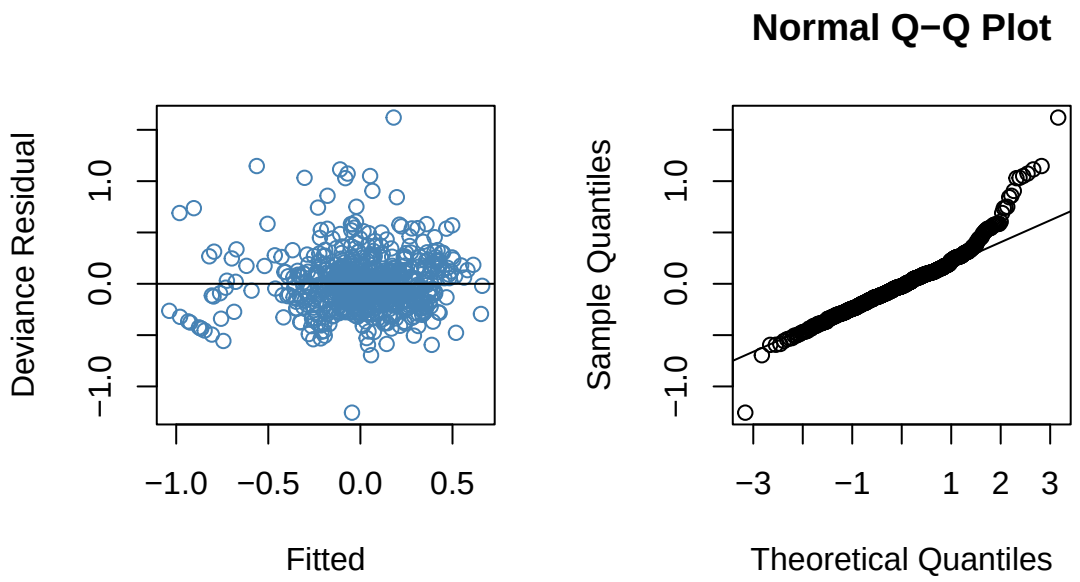
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-20	2018	10	impact	before	1.8000	0.1805	5.776	Y
Chedakuz Creek	CC-10	2020	10	impact	before	-1.3010	-0.0457	-4.477	N
Fawnie Creek (Control)	FC-01	2023	5	control	after	0.5846	-0.5626	4.091	Y
Creek 705 (Control)	705-05	2025	12	control	after	1.0043	-0.1099	3.974	Y
Chedakuz Creek	CC-10	2021	11	impact	before	1.0043	-0.0693	3.829	Y
Chedakuz Creek	CC-10	2022	10	impact	after	1.1027	0.0527	3.745	Y
Creek 705 (Control)	705-10	2023	7	control	after	0.7292	-0.3031	3.682	Y
Chedakuz Creek	CC-10	2021	10	impact	before	0.9474	-0.0817	3.671	Y
Chedakuz Creek	CC-10	2022	11	impact	after	0.9703	0.0652	3.228	Y
Creek 705 (Control)	705-10	2019	7	control	before	0.6790	-0.1785	3.058	Y
Chedakuz Creek	CC-10	2024	11	impact	after	1.0414	0.1978	3.009	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.53236	0.53236	1	8.071	6.7718	0.0313	
period	0.01314	0.01314	1	16.661	0.1672	0.688	
class:period	1.18820	1.18820	1	616.243	15.1145	<0.001	0.000241

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
637	0.2341	100%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (CC-05, CC-10, CC-15, CC-20, CC-30, CC-40) and control sites (CC-03, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

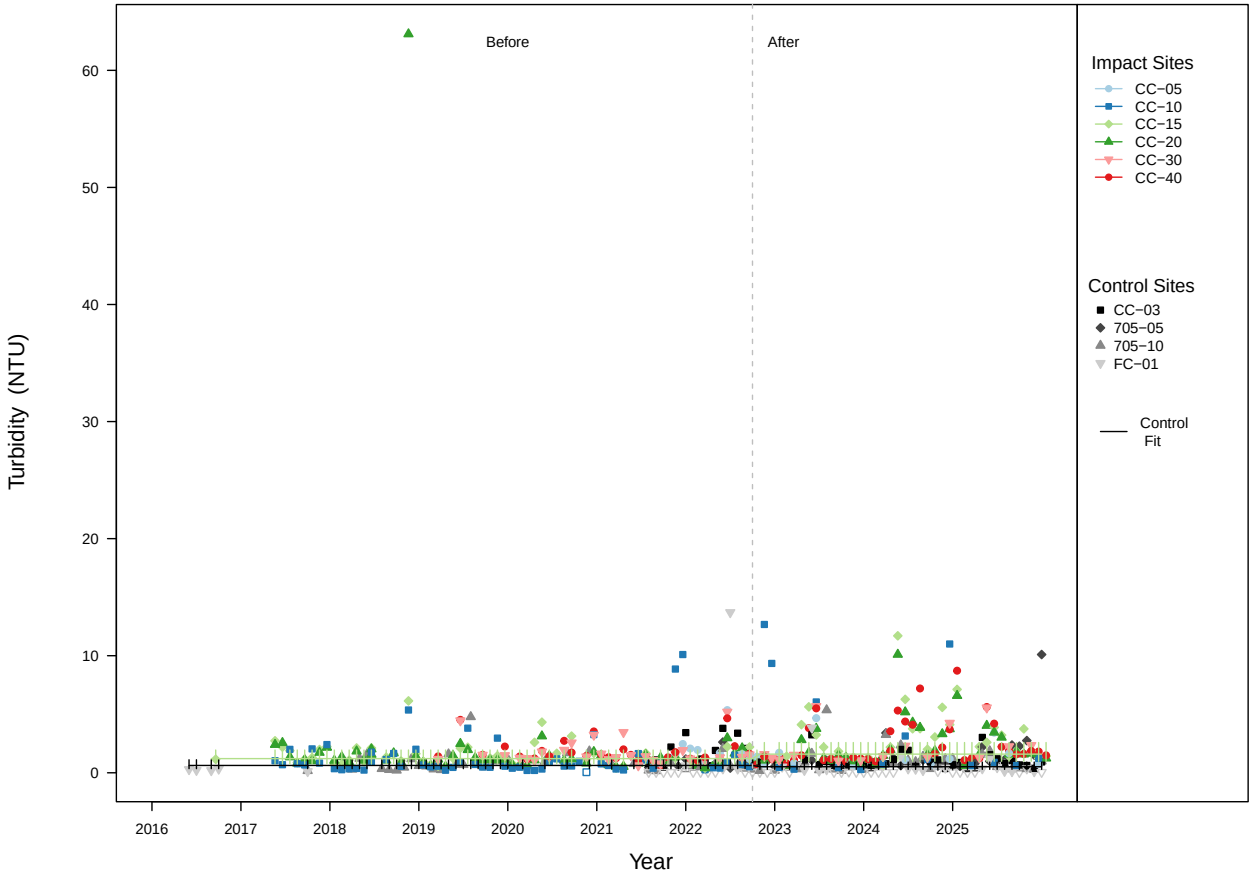
Impact vs.	Estimate	Significance
control sites	0.2026	significant

Conclusion:

The change in Turbidity concentrations at the impact sites from *before* to *after* was significantly (*adjusted p* = 2.41×10^{-4}) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

Variable	Turbidity

1.2 Sample Sizes for Modelling

The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
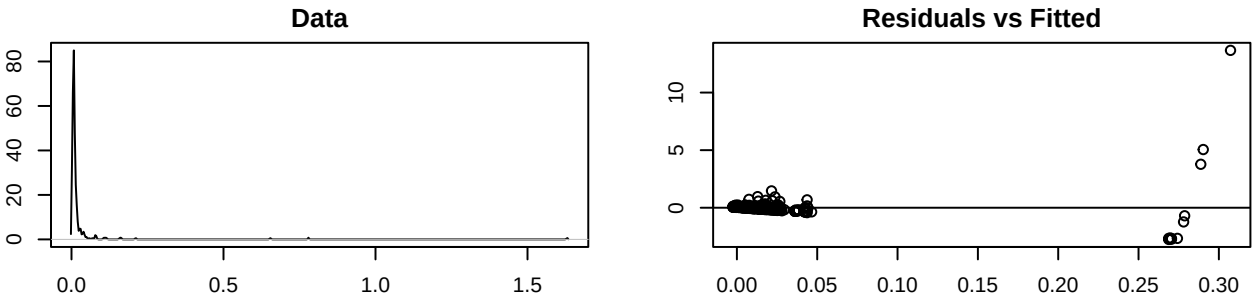
Chedakuz Creek	CC-10	before	12	0.0078	16.667
Chedakuz Creek	CC-15	before	12	0.0088	8.333
Chedakuz Creek	CC-20	before	61	0.0068	27.869
Chedakuz Creek	CC-20	after	38	0.0082	13.158
Chedakuz Creek	CC-30	before	30	0.0082	20.000
Chedakuz Creek	CC-30	after	16	0.0080	18.750
Chedakuz Creek	CC-40	before	34	0.0089	17.647
Chedakuz Creek	CC-40	after	40	0.0094	20.000
Chedakuz Creek	CC-03	before	12	0.0158	16.667
Chedakuz Creek	CC-03	after	36	0.0086	19.444
Creek 705 (Control)	705-10	before	12	0.0058	50.000

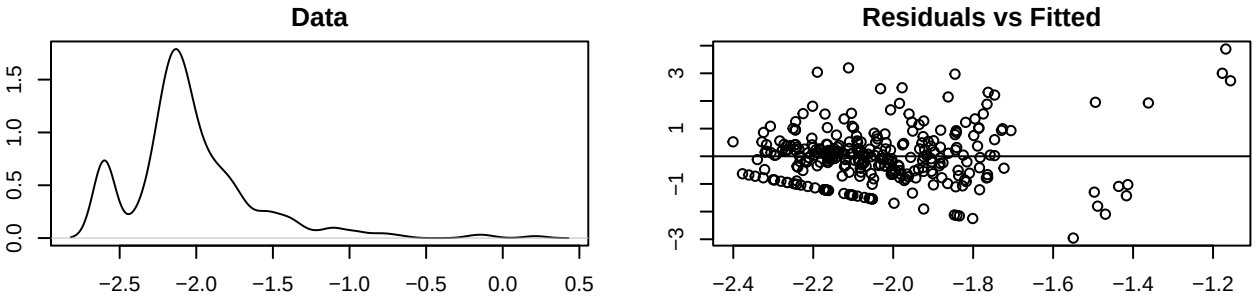
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-03	2021	12	control	before	1.6300	0.3073	13.665	Y
Chedakuz Creek	CC-03	2022	2	control	before	0.7794	0.2903	5.053	Y
Chedakuz Creek	CC-03	2022	3	control	before	0.6540	0.2887	3.773	Y

Outliers on log scale:

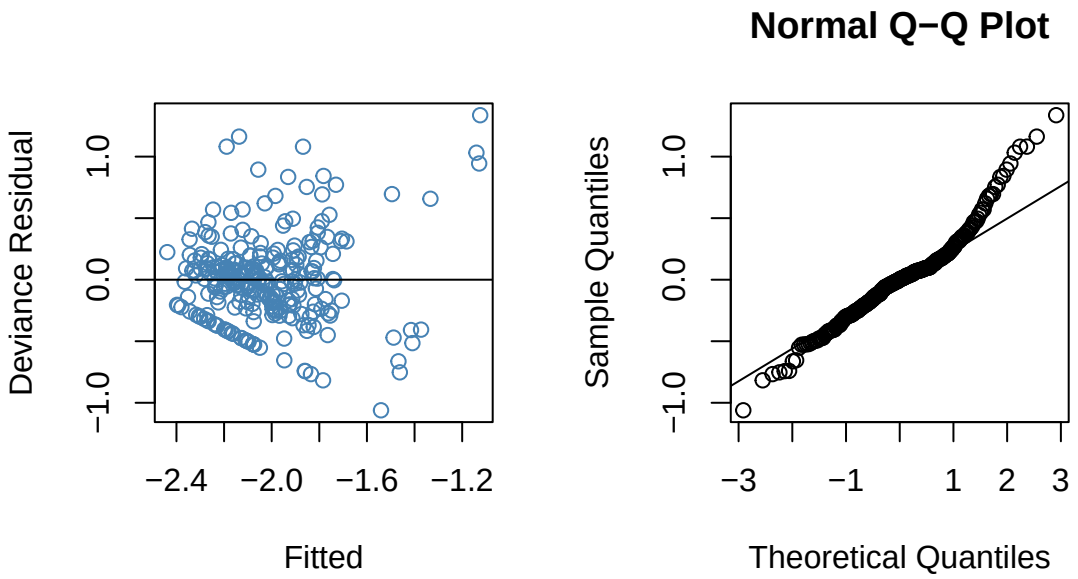
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-03	2021	12	control	before	0.2122	-1.168	3.878	Y
Chedakuz Creek	CC-20	2024	10	impact	after	-0.9744	-2.112	3.196	Y
Chedakuz Creek	CC-20	2018	4	impact	before	-1.1079	-2.190	3.039	Y
Chedakuz Creek	CC-03	2022	2	control	before	-0.1082	-1.177	3.002	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.004942	0.004942	1	3.005	0.0385	0.857	
period	1.442173	1.442173	1	23.722	11.2277	0.00269	
class:period	4.516012	4.516012	1	258.043	35.1582	<0.001	5.22e-08

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
303	0.0921	24%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (CC-20, CC-30, CC-40) and control sites (CC-03, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

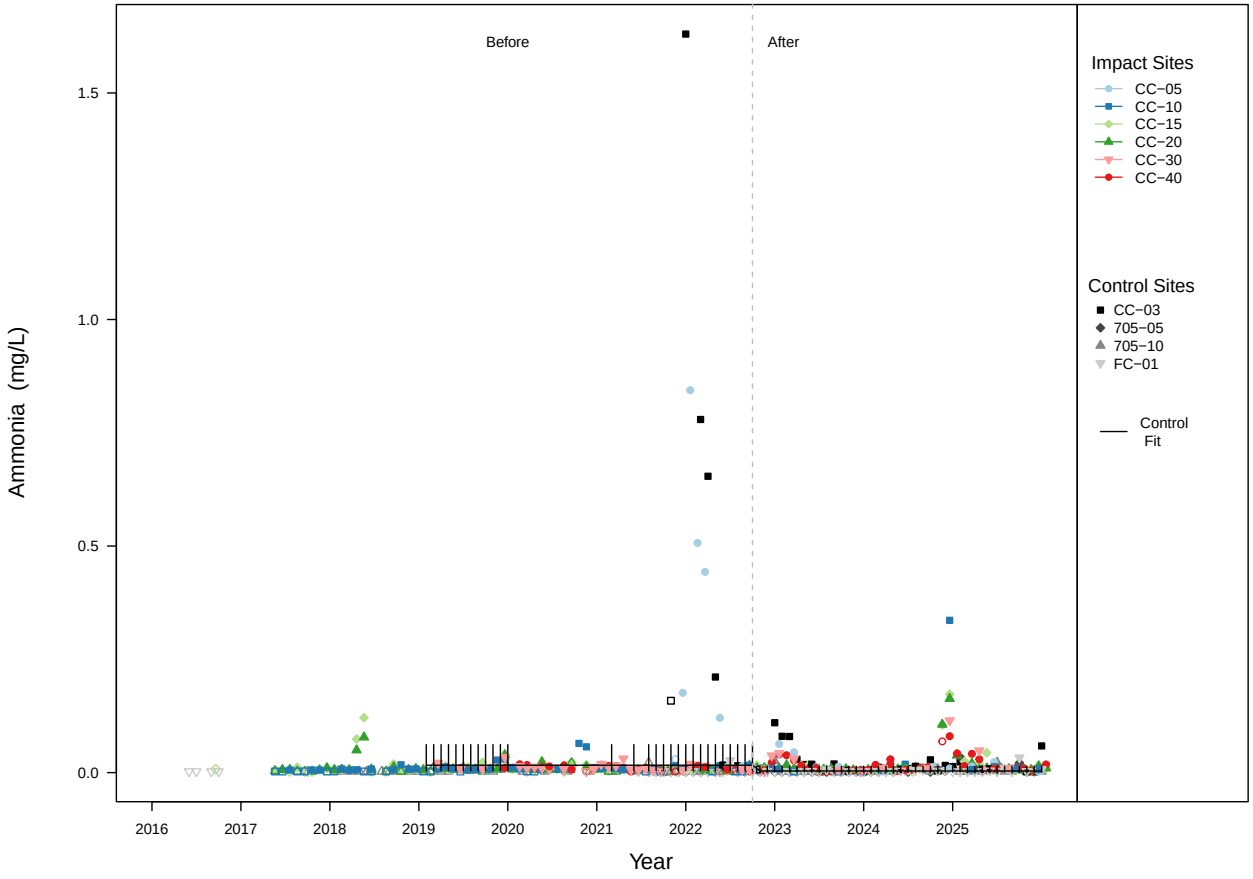
Impact vs.	Estimate	Significance
control sites	0.7958	significant

Conclusion:

The change in Ammonia concentrations at the impact sites from *before* to *after* was significantly (*adjusted* $p = 5.22 \times 10^{-8}$) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

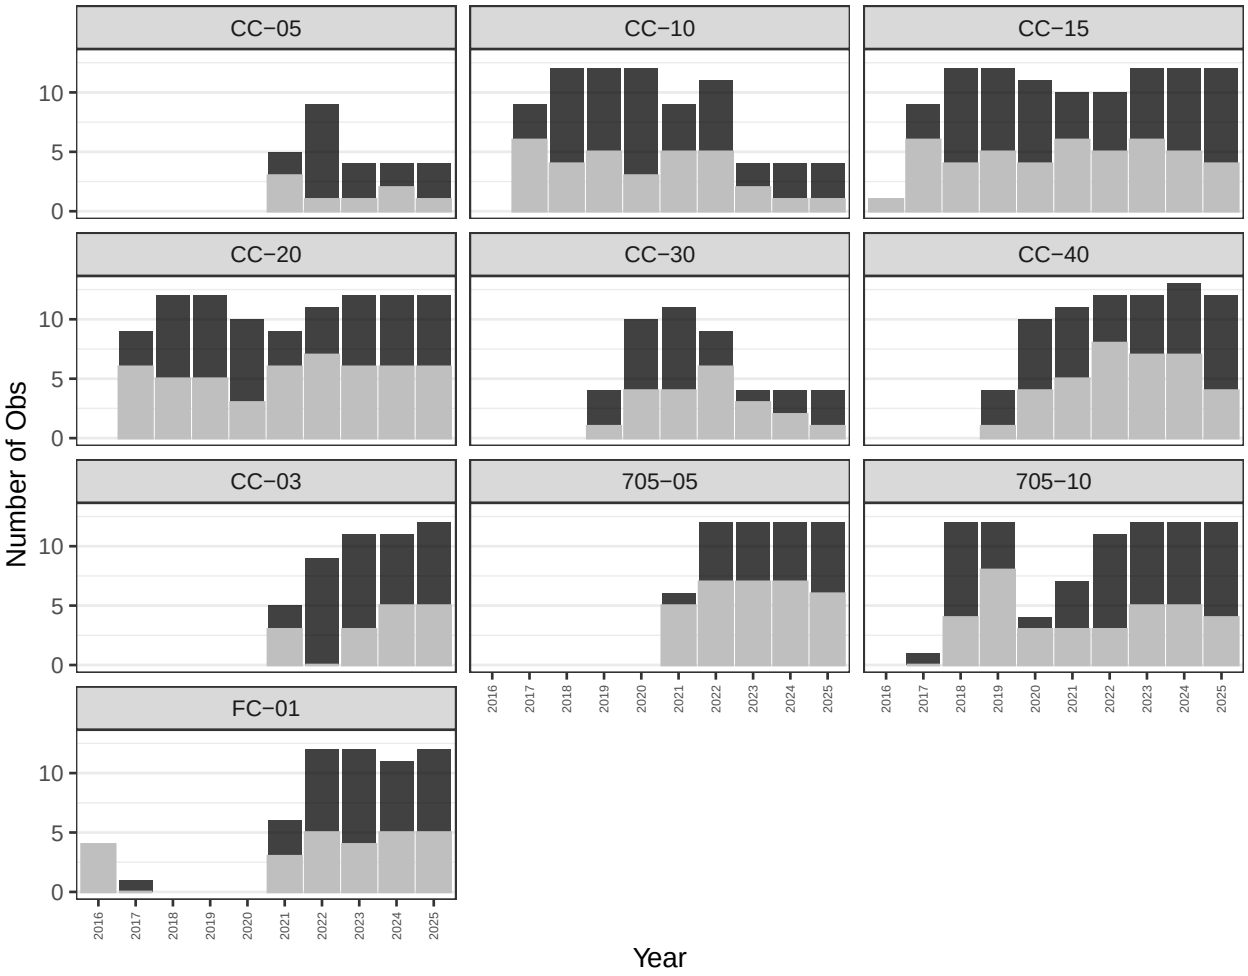
Final Summary Table

Variable	Ammonia
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	CC-05, 705-05, FC-01, CC-10, CC-15
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	Yes

A-12.3.6 Nitrate-N

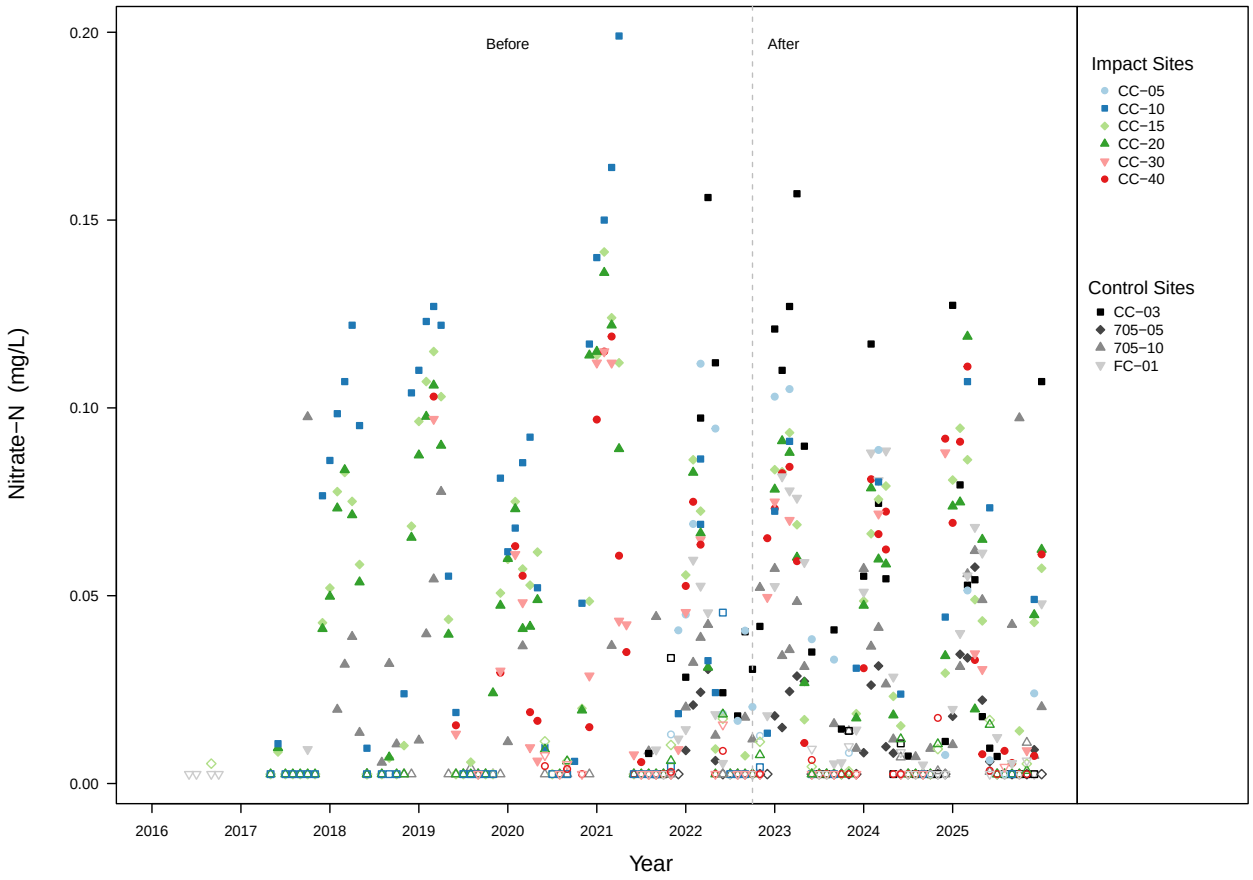
1 Chedakuz Creek

1.1 Censored Data The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Conclusion:

Statistical analyses were not conducted due to censoring or availability of observations. Below is a summary figure of all observations in the dataset.



Note: Open symbols represent cases where the results were below the sample detection limit.

Final Summary Table

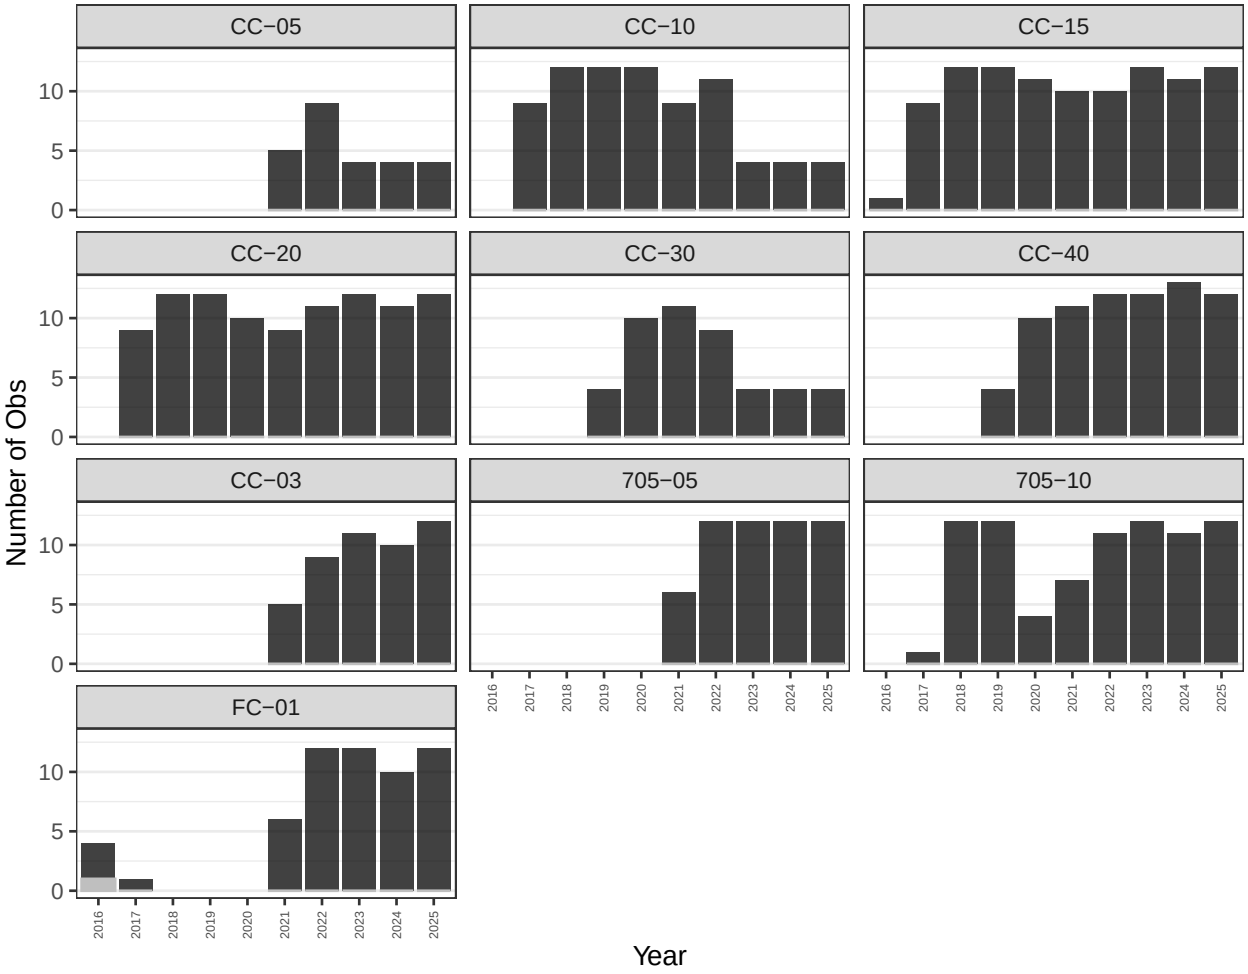
Variable	Nitrate-N
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	All Excluded
Data Transformation	N/A
Model Type	N/A
Benchmark	None
Significant BACI term	N/A

A-12.3.7 Total Phosphorus

1 Chedakuz Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

1.2 Sample Sizes for Modelling

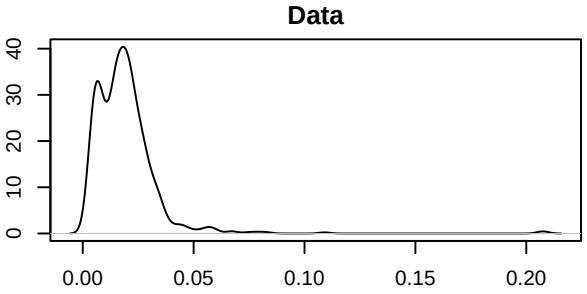
The remaining sample sizes per site and period are summarised in the table below.

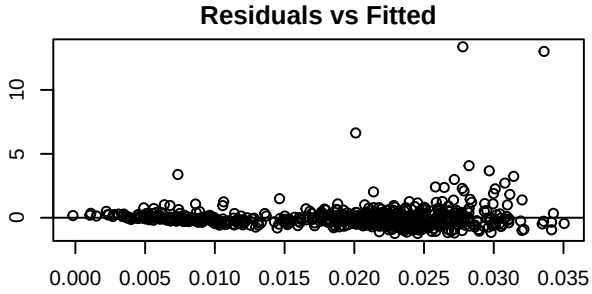
Watershed	Site	Period	N	Median	% Censored
Chedakuz Creek	CC-05	before	12	0.0273	0
Chedakuz Creek	CC-05	after	14	0.0234	0
Chedakuz Creek	CC-10	before	62	0.0266	0
Chedakuz Creek	CC-10	after	15	0.0270	0
Chedakuz Creek	CC-15	before	63	0.0203	0
Chedakuz Creek	CC-15	after	37	0.0206	0
Chedakuz Creek	CC-20	before	61	0.0191	0
Chedakuz Creek	CC-20	after	37	0.0199	0
Chedakuz Creek	CC-30	before	30	0.0195	0
Chedakuz Creek	CC-30	after	16	0.0192	0
Chedakuz Creek	CC-40	before	34	0.0190	0
Chedakuz Creek	CC-40	after	40	0.0181	0
Chedakuz Creek	CC-03	before	12	0.0286	0
Chedakuz Creek	CC-03	after	35	0.0203	0
Creek 705 (Control)	705-05	before	15	0.0079	0
Creek 705 (Control)	705-05	after	39	0.0084	0
Creek 705 (Control)	705-10	before	45	0.0059	0
Creek 705 (Control)	705-10	after	37	0.0061	0
Fawnie Creek (Control)	FC-01	before	20	0.0043	5
Fawnie Creek (Control)	FC-01	after	37	0.0059	0

1.3 Initial Model Fit

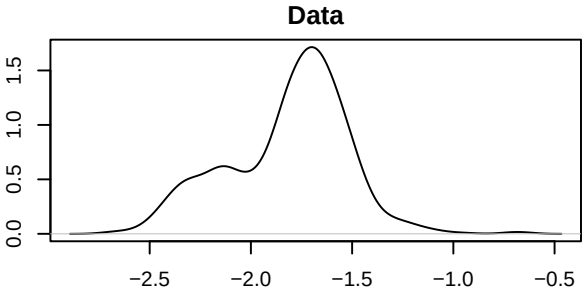
Initially a model was fit to all sites to assess the need for transformations.

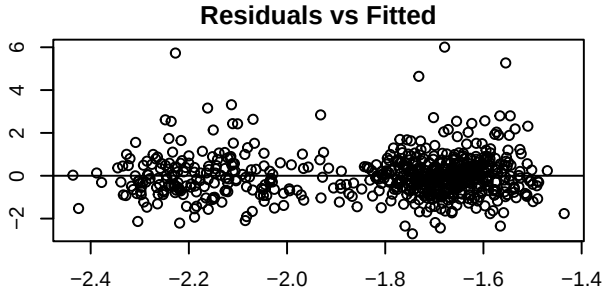
Natural Scale Model





Log−10 Transformed Model





Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-20	2018	10	impact	before	0.2070	0.0278	13.373	Y
Chedakuz Creek	CC-10	2024	11	impact	after	0.2080	0.0336	13.013	Y
Chedakuz Creek	CC-40	2020	7	impact	before	0.1090	0.0201	6.633	Y
Chedakuz Creek	CC-15	2025	4	impact	after	0.0828	0.0282	4.072	Y
Chedakuz Creek	CC-10	2023	5	impact	after	0.0789	0.0297	3.673	Y
Fawnie Creek (Control)	FC-01	2022	6	control	before	0.0527	0.0074	3.384	Y
Chedakuz Creek	CC-15	2018	4	impact	before	0.0748	0.0314	3.236	Y

Outliers on log scale:

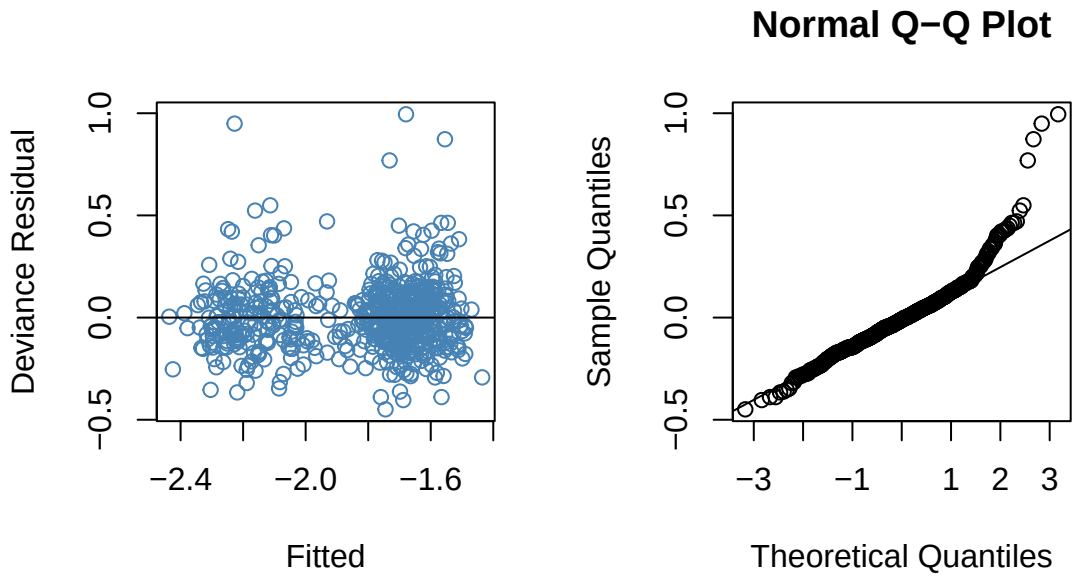
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-20	2018	10	impact	before	-0.6840	-1.679	6.005	Y
Fawnie Creek (Control)	FC-01	2022	6	control	before	-1.2782	-2.227	5.729	Y
Chedakuz Creek	CC-10	2024	11	impact	after	-0.6819	-1.555	5.267	Y
Chedakuz Creek	CC-40	2020	7	impact	before	-0.9626	-1.732	4.641	Y
Creek 705 (Control)	705-10	2024	3	control	after	-1.5638	-2.113	3.316	Y
Fawnie Creek (Control)	FC-01	2023	5	control	after	-1.6383	-2.162	3.160	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.298137	0.298137	1	8.021	10.8594	0.0109	
period	0.006092	0.006092	1	56.426	0.2219	0.6390	
class:period	0.022378	0.022378	1	640.114	0.8151	0.3670	0.394

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
661	0.4766	100%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (CC-05, CC-10, CC-15, CC-20, CC-30, CC-40) and control sites (CC-03, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

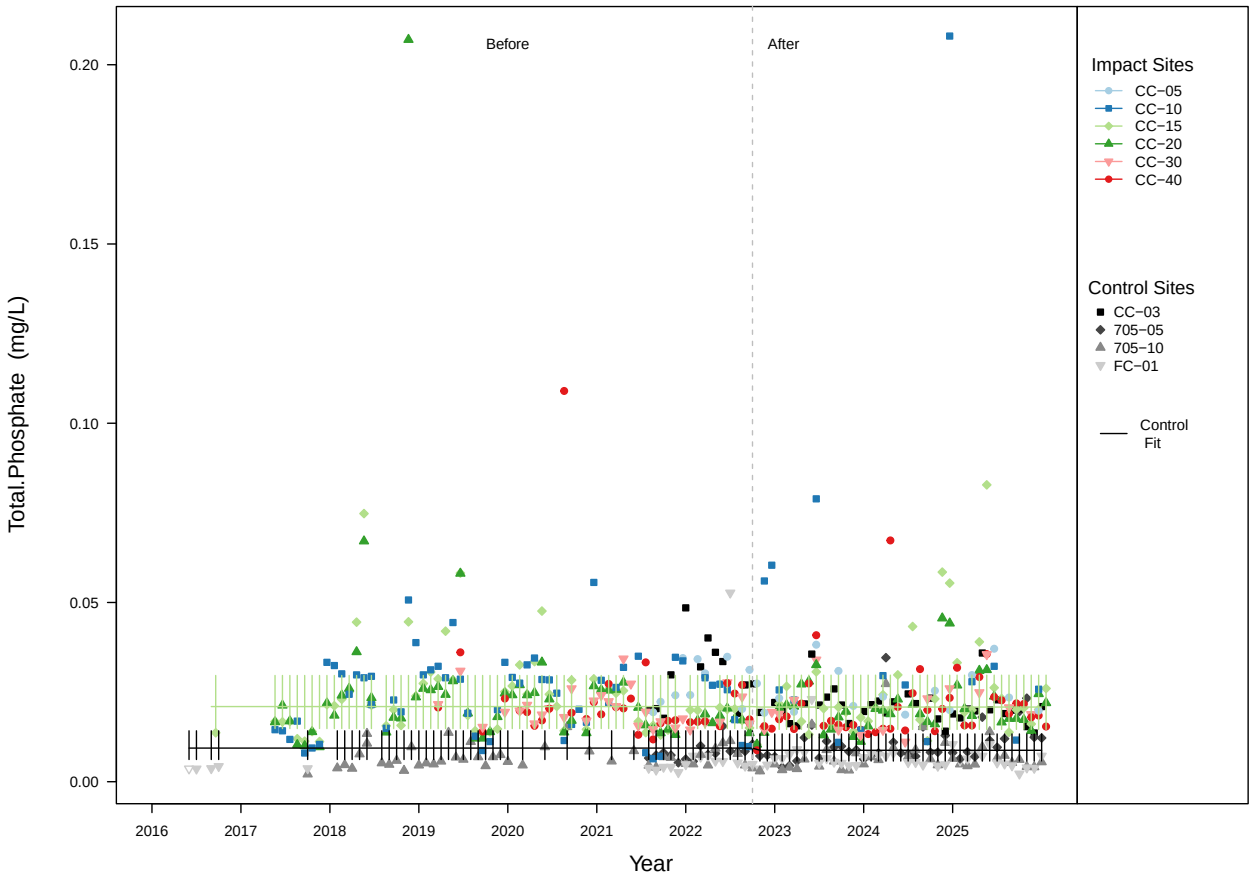
Impact vs.	Estimate	Significance
control sites	0.0266	not significant

Conclusion:

The change in Total.Phosphate concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.394) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

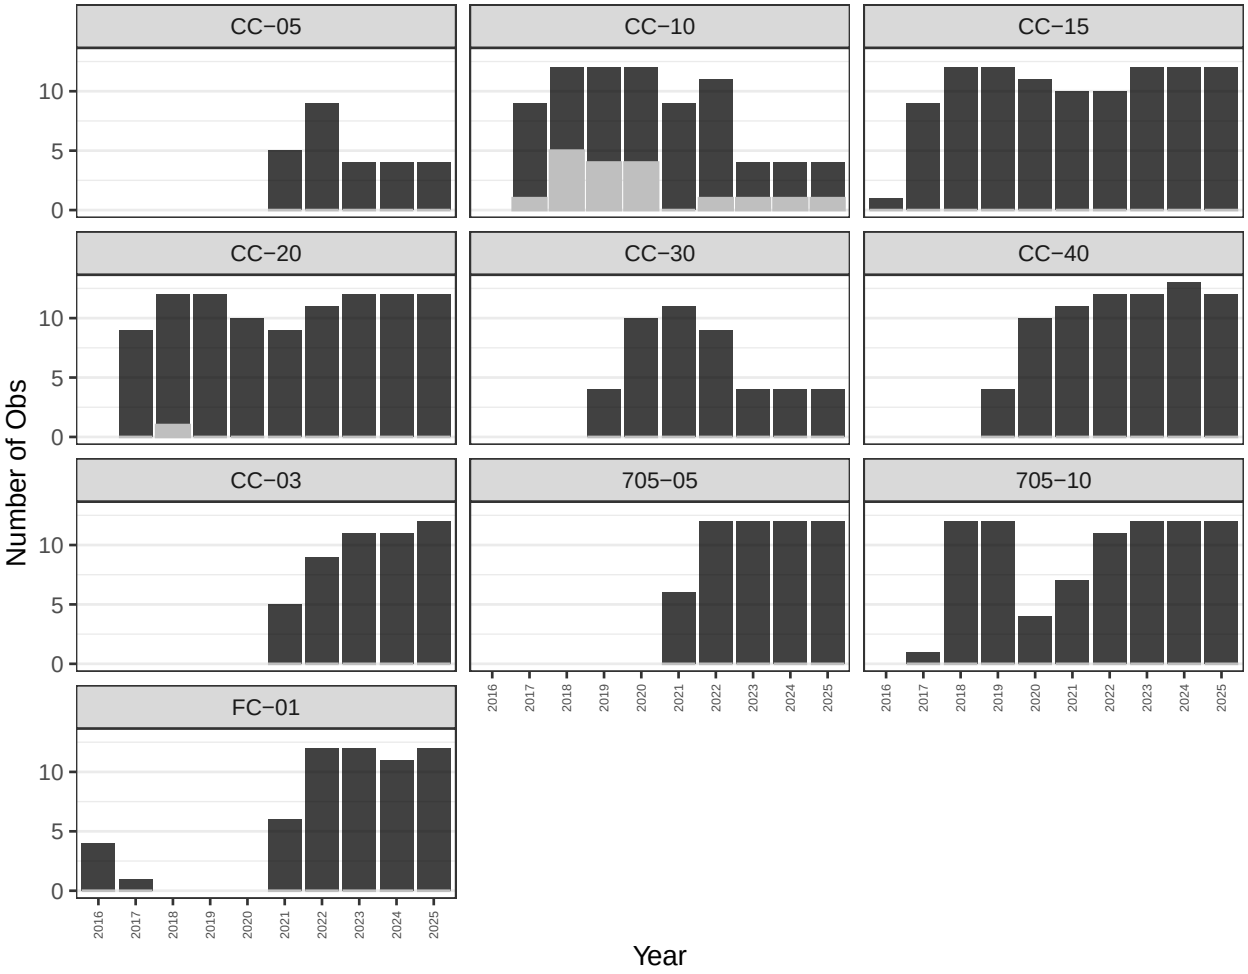
Variable	Total.Phosphate
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

A-12.3.8 Total Aluminum

1 Chedakuz Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

1.2 Sample Sizes for Modelling

The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Chedakuz Creek	CC-05	before	12	0.0363	0.000
Chedakuz Creek	CC-05	after	14	0.0307	0.000
Chedakuz Creek	CC-10	before	62	0.0072	24.194
Chedakuz Creek	CC-10	after	15	0.0052	20.000

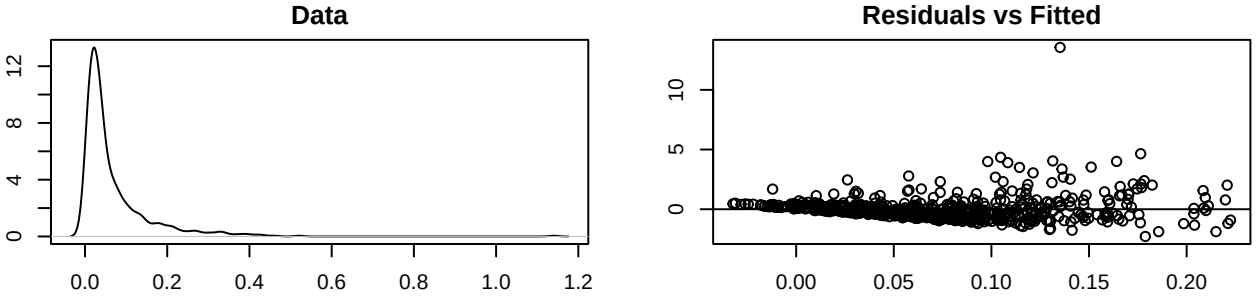
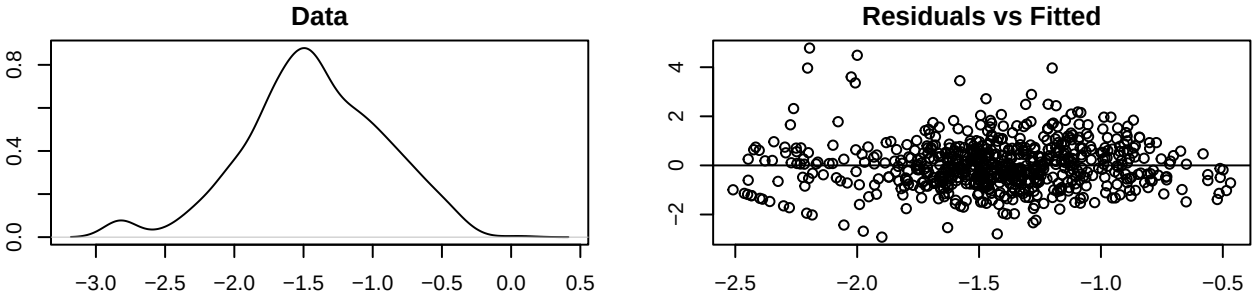
Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Fawnie Creek (Control)	FC-01	2022	6	control	before	1.1400	0.1352	13.554	Y
Chedakuz Creek	CC-15	2024	4	impact	after	0.5210	0.1765	4.647	Y
Chedakuz Creek	CC-40	2024	12	impact	after	0.4270	0.1047	4.347	Y
Creek 705 (Control)	705-10	2019	7	control	before	0.4315	0.1314	4.048	Y
Chedakuz Creek	CC-20	2024	4	impact	after	0.4610	0.1641	4.005	Y
Creek 705 (Control)	705-05	2024	3	control	after	0.3940	0.0981	3.991	Y
Creek 705 (Control)	705-10	2024	3	control	after	0.3975	0.1084	3.900	Y
Chedakuz Creek	CC-05	2022	5	impact	before	0.4128	0.1511	3.530	Y
Chedakuz Creek	CC-15	2024	12	impact	after	0.3740	0.1144	3.502	Y
Fawnie Creek (Control)	FC-01	2023	5	control	after	0.3860	0.1362	3.369	Y
Chedakuz Creek	CC-40	2024	7	impact	after	0.3470	0.1213	3.044	Y

Outliers on log scale:

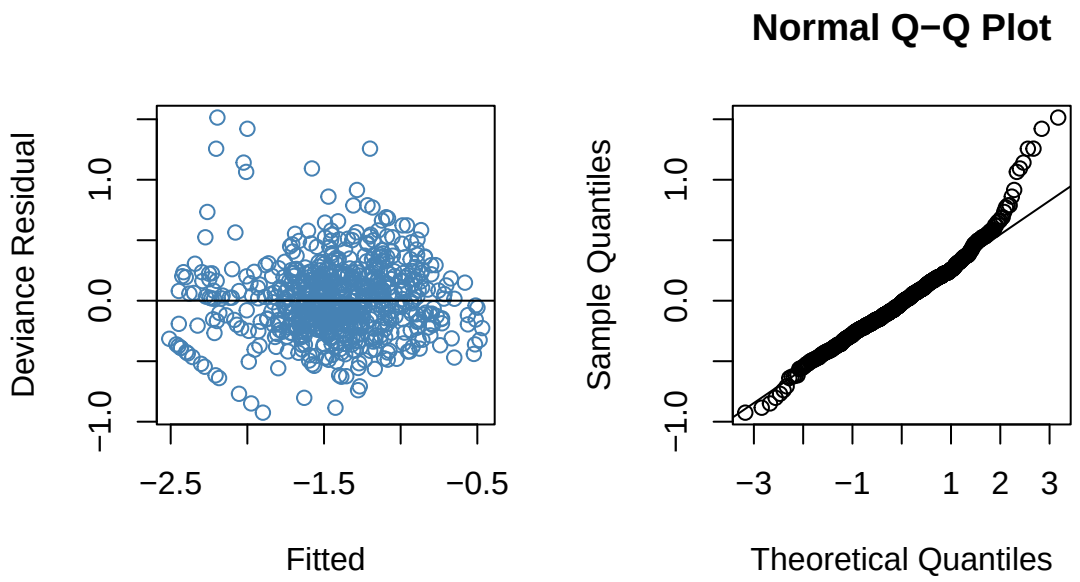
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-10	2022	10	impact	after	-0.6814	-2.195	4.779	Y
Chedakuz Creek	CC-10	2022	11	impact	after	-0.5784	-2.000	4.486	Y
Fawnie Creek (Control)	FC-01	2022	6	control	before	0.0569	-1.200	3.967	Y
Chedakuz Creek	CC-10	2021	10	impact	before	-0.9472	-2.204	3.965	Y
Chedakuz Creek	CC-10	2020	11	impact	before	-0.8827	-2.024	3.603	Y
Chedakuz Creek	CC-10	2023	5	impact	after	-0.4855	-1.579	3.450	Y
Chedakuz Creek	CC-10	2021	11	impact	before	-0.9431	-2.008	3.360	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.06321	0.06321	1	8.023	0.6296	0.45	
period	0.24382	0.24382	1	24.800	2.4288	0.132	
class:period	2.02686	2.02686	1	644.606	20.1898	<0.001	2.38e-05

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
666	0.0316	9%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (CC-05, CC-10, CC-15, CC-20, CC-30, CC-40) and control sites (CC-03, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

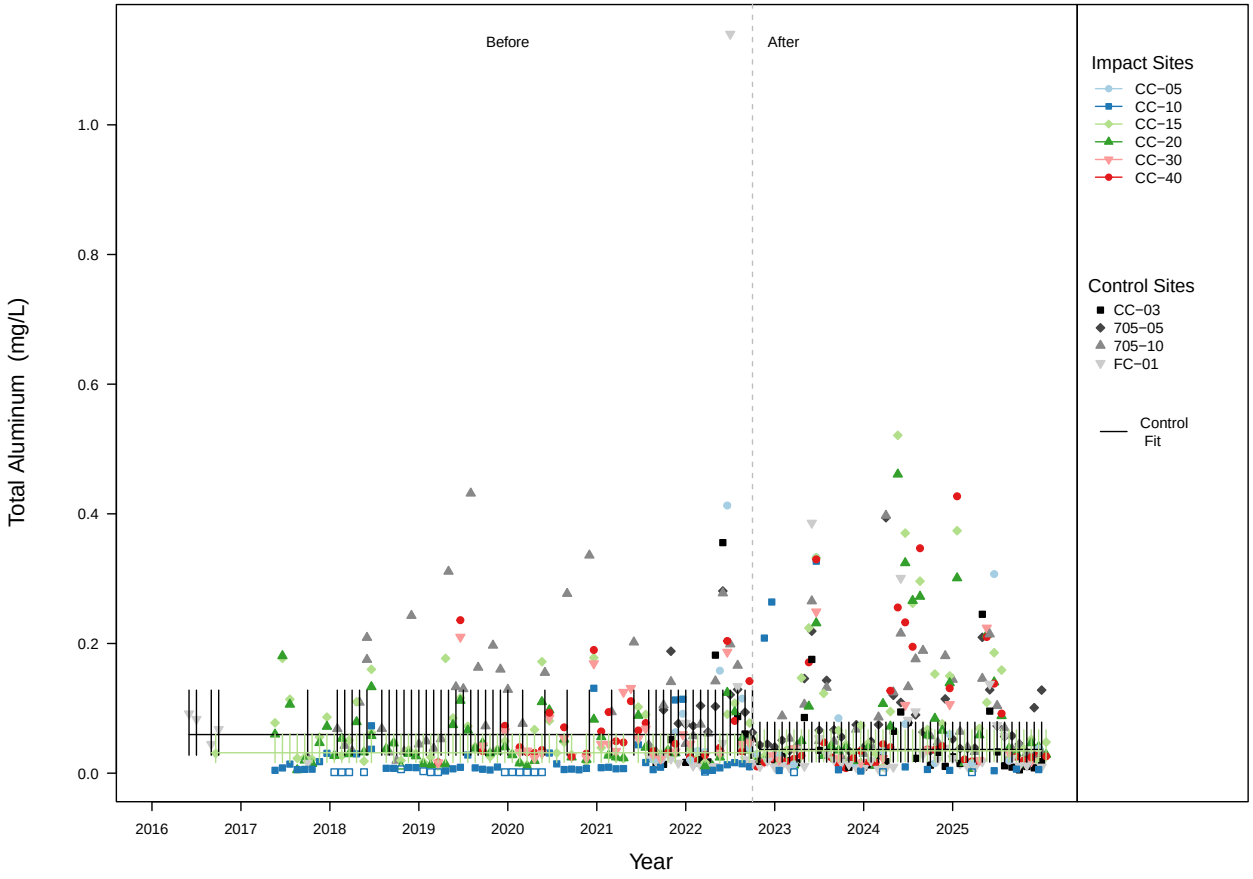
Impact vs.	Estimate	Significance
control sites	0.2512	significant

Conclusion:

The change in Total Aluminum concentrations at the impact sites from *before* to *after* was significantly (*adjusted p* = 2.38×10^{-5}) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

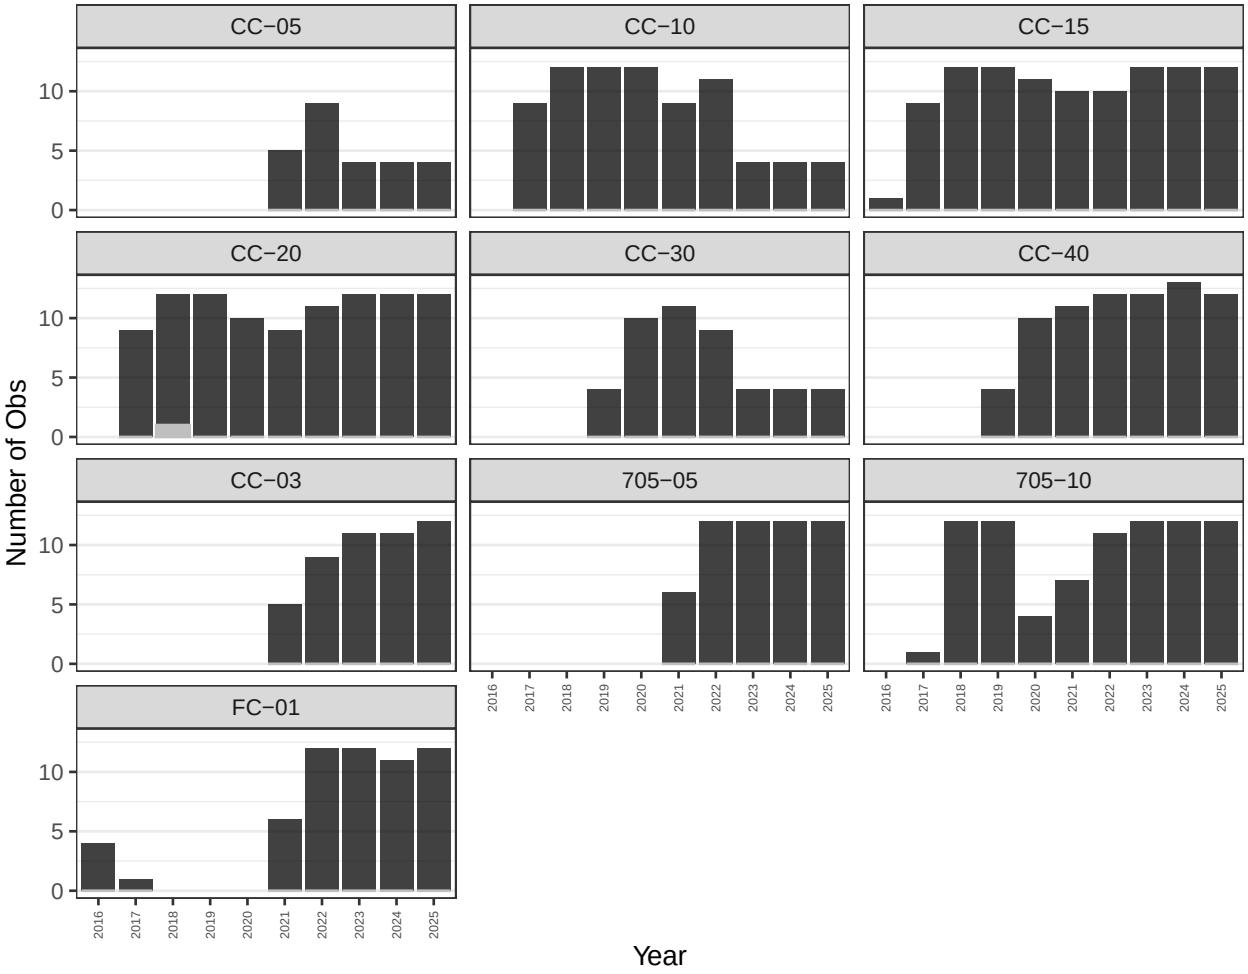
Variable	Total Aluminum
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	Yes

A-12.3.9 Total Arsenic

1 Chedakuz Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

1.2 Sample Sizes for Modelling

The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Chedakuz Creek	CC-05	before	12	0.0007	0.000
Chedakuz Creek	CC-05	after	14	0.0007	0.000
Chedakuz Creek	CC-10	before	62	0.0006	0.000
Chedakuz Creek	CC-10	after	15	0.0006	0.000
Chedakuz Creek	CC-15	before	63	0.0006	0.000

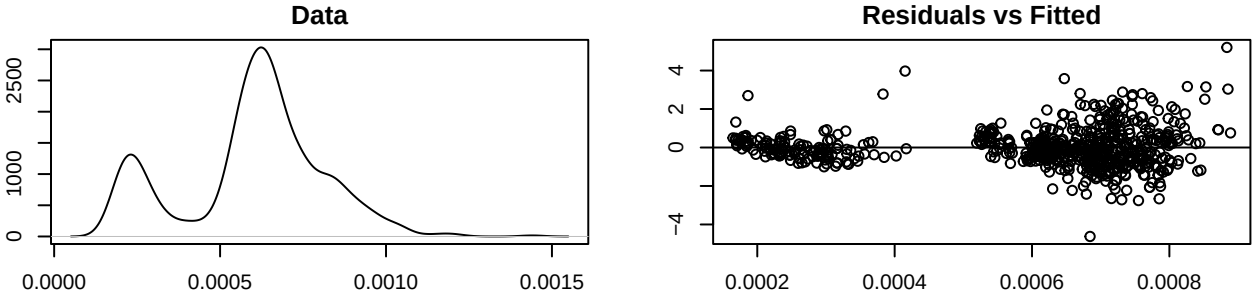
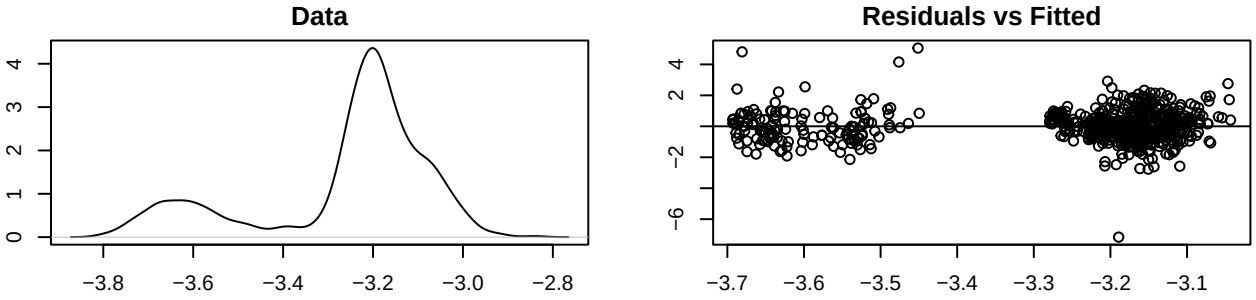
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-40	2025	8	impact	after	0.0014	0.0009	5.201	Y
Fawnie Creek (Control)	FC-01	2021	12	control	before	0.0002	0.0007	-4.624	Y
Creek 705 (Control)	705-05	2025	8	control	after	0.0008	0.0004	3.971	Y
Chedakuz Creek	CC-03	2021	12	control	before	0.0010	0.0006	3.581	Y
Chedakuz Creek	CC-15	2025	8	impact	after	0.0012	0.0008	3.168	Y
Chedakuz Creek	CC-40	2024	9	impact	after	0.0012	0.0009	3.149	Y
Chedakuz Creek	CC-40	2024	8	impact	after	0.0012	0.0009	3.035	Y

Outliers on log scale:

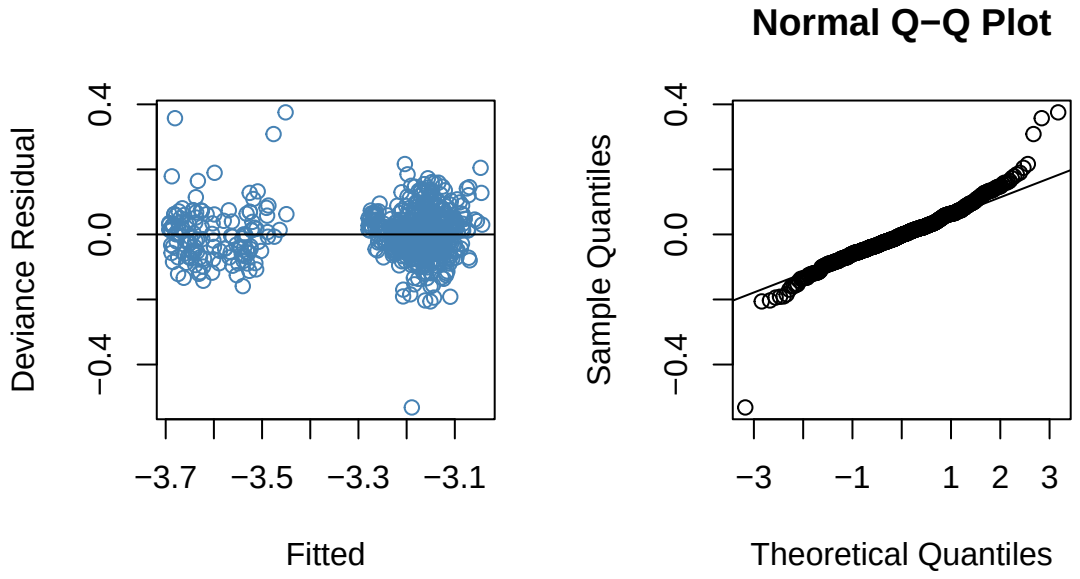
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Fawnie Creek (Control)	FC-01	2021	12	control	before	-3.721	-3.189	-7.160	Y
Creek 705 (Control)	705-05	2025	8	control	after	-3.076	-3.451	5.053	Y
Creek 705 (Control)	705-10	2021	12	control	before	-3.323	-3.681	4.811	Y
Creek 705 (Control)	705-05	2025	9	control	after	-3.167	-3.476	4.154	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.023531	0.023531	1	8.004	4.2628	0.0728	
period	0.098679	0.098679	1	12.370	17.8760	0.0011	
class:period	0.005418	0.005418	1	626.964	0.9814	0.3220	0.355

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
666	0.3129	100%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (CC-05, CC-10, CC-15, CC-20, CC-30, CC-40) and control sites (CC-03, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

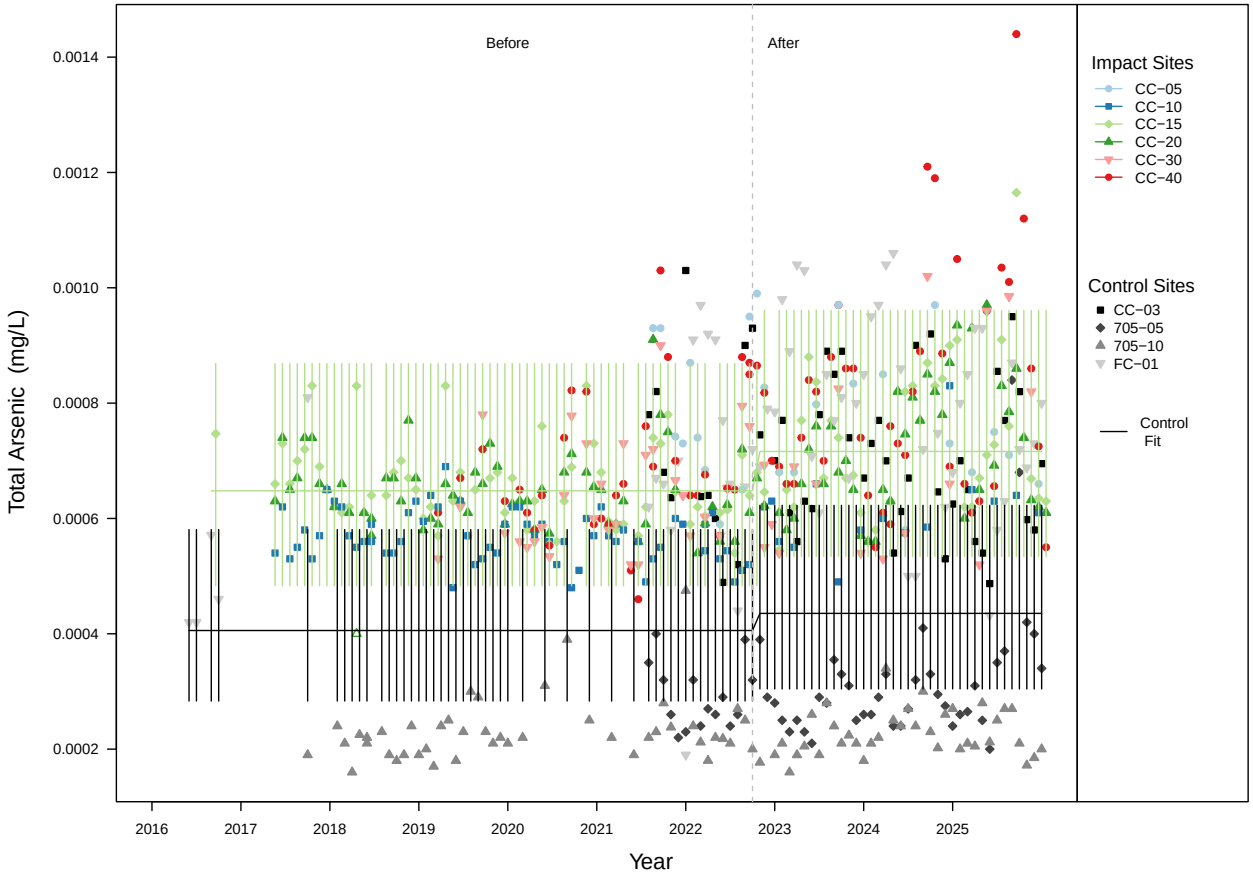
Impact vs.	Estimate	Significance
control sites	0.0129	not significant

Conclusion:

The change in Total Arsenic concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.355) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

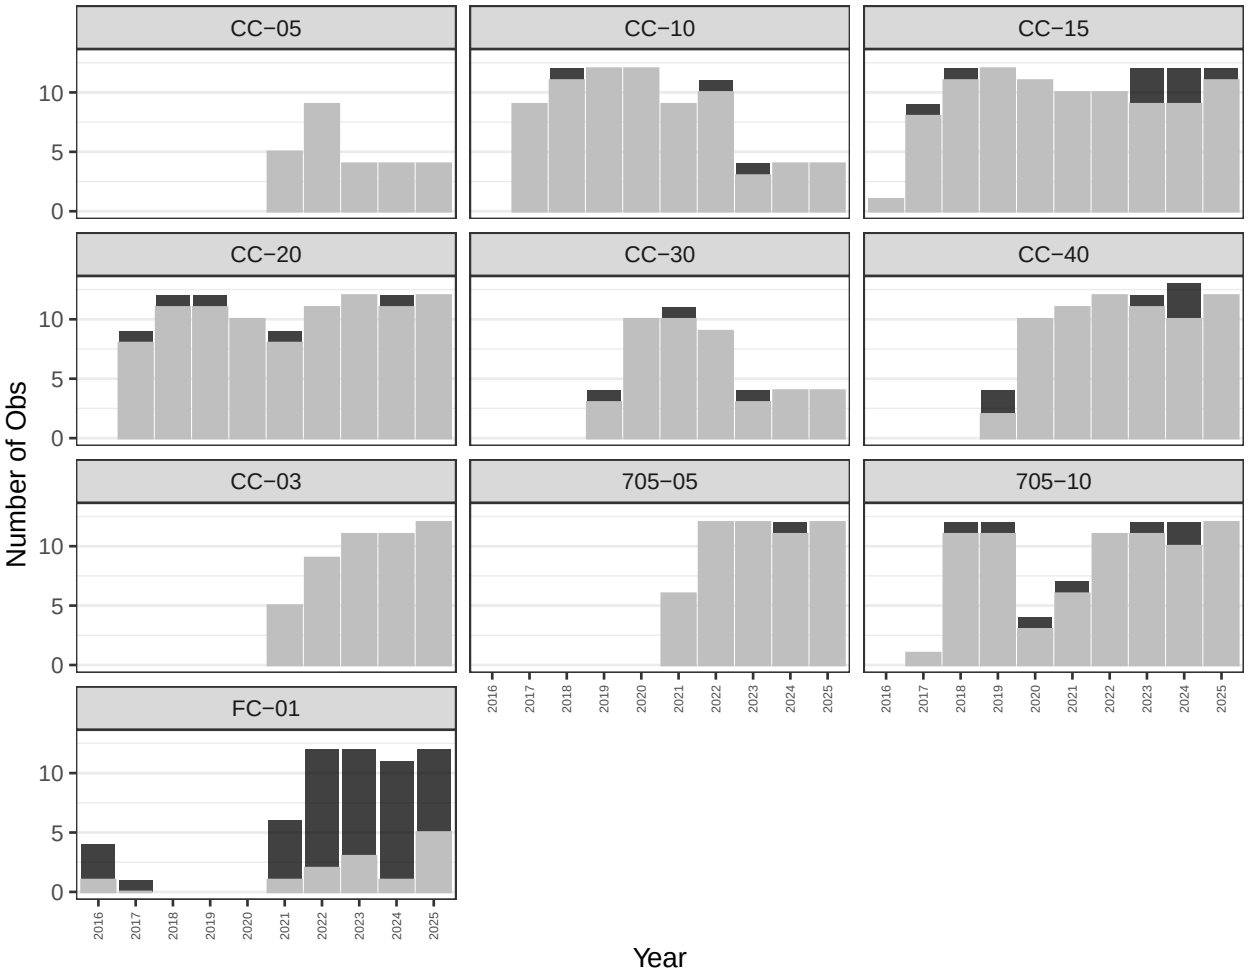
Final Summary Table

Variable	Total Arsenic
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

A-12.3.10 Total Cadmium

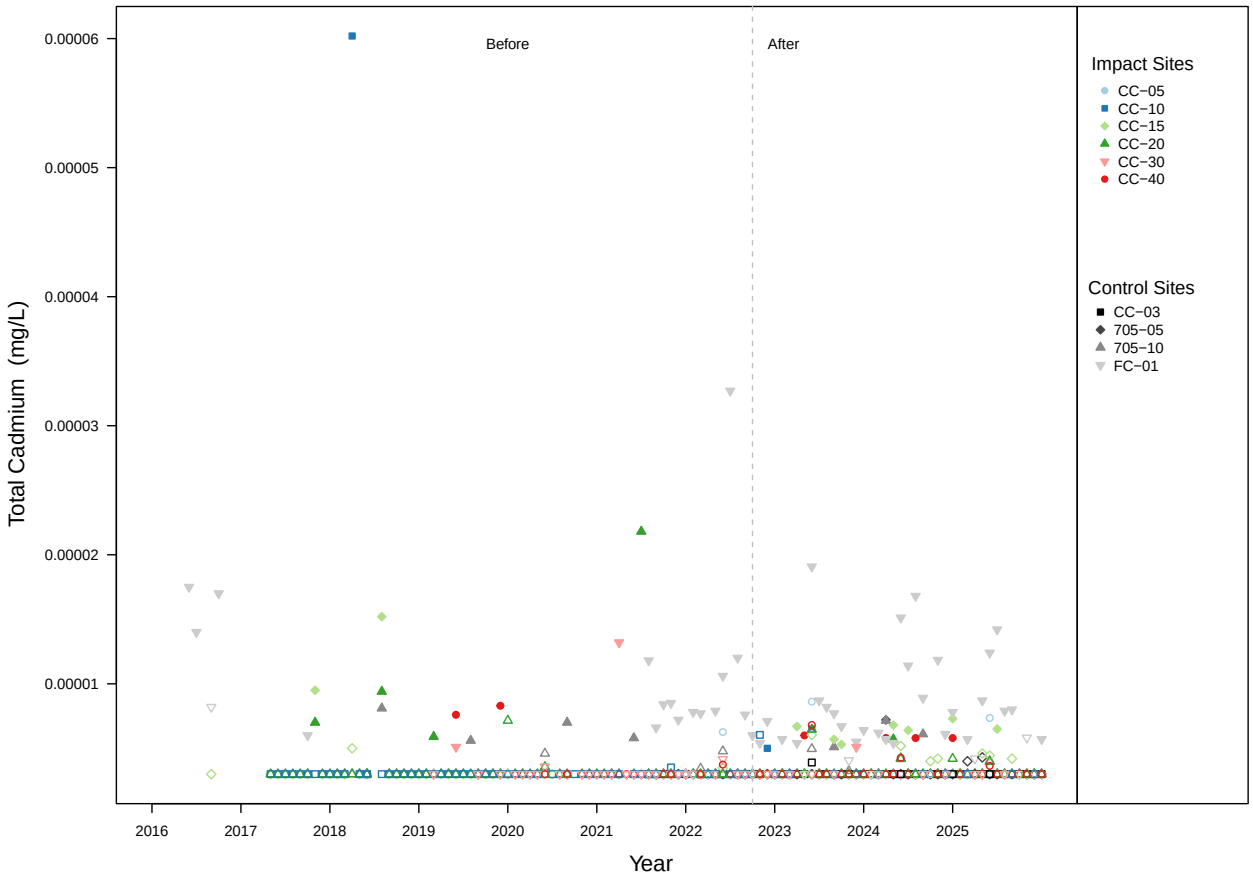
1 Chedakuz Creek

1.1 Censored Data The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Conclusion:

Statistical analyses were not conducted due to censoring or availability of observations. Below is a summary figure of all observations in the dataset.



Note: Open symbols represent cases where the results were below the sample detection limit.

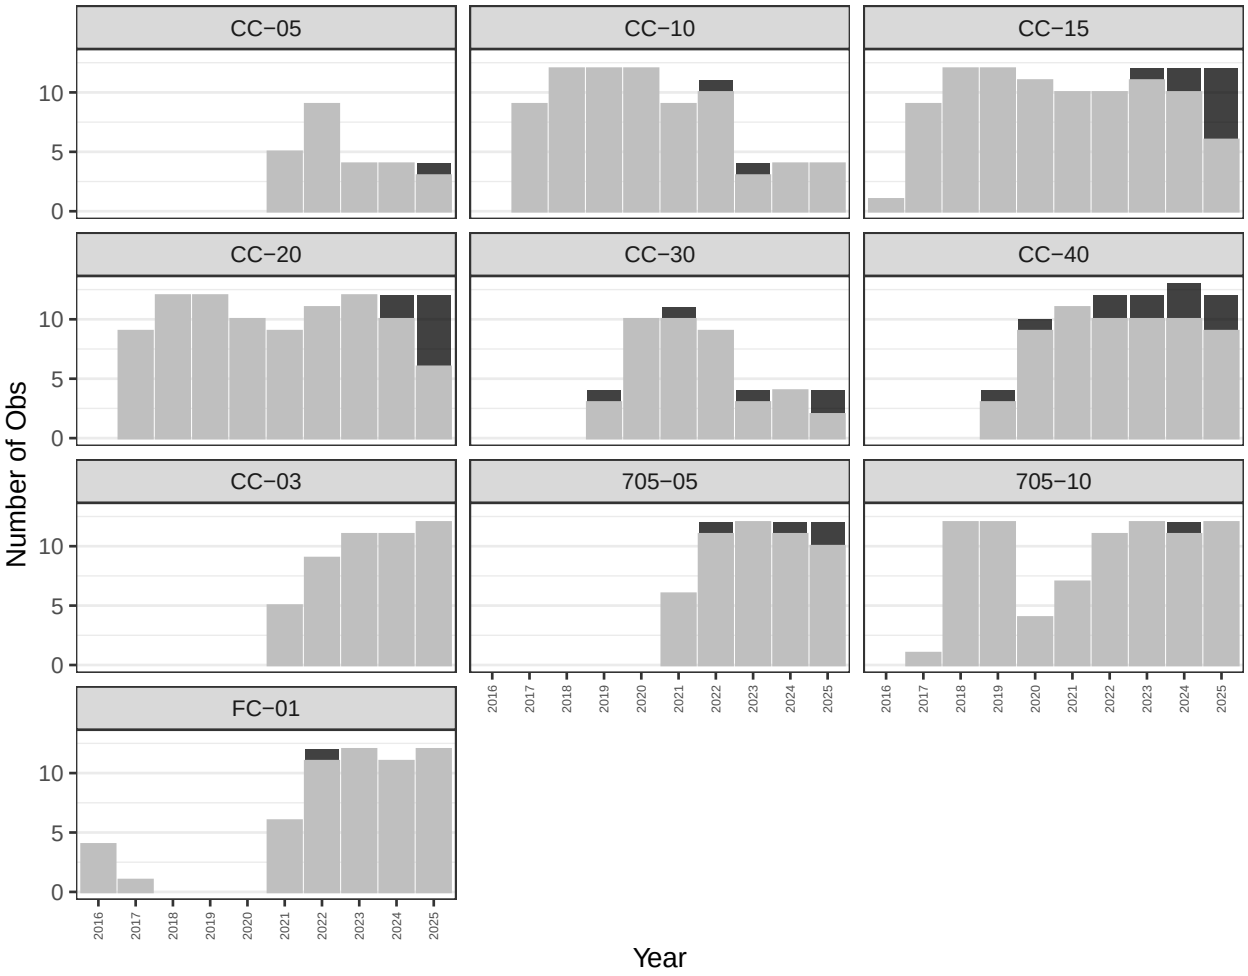
Final Summary Table

Variable	Total Cadmium
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	All Excluded
Data Transformation	N/A
Model Type	N/A
Benchmark	None
Significant BACI term	N/A

A-12.3.11 Total Cobalt

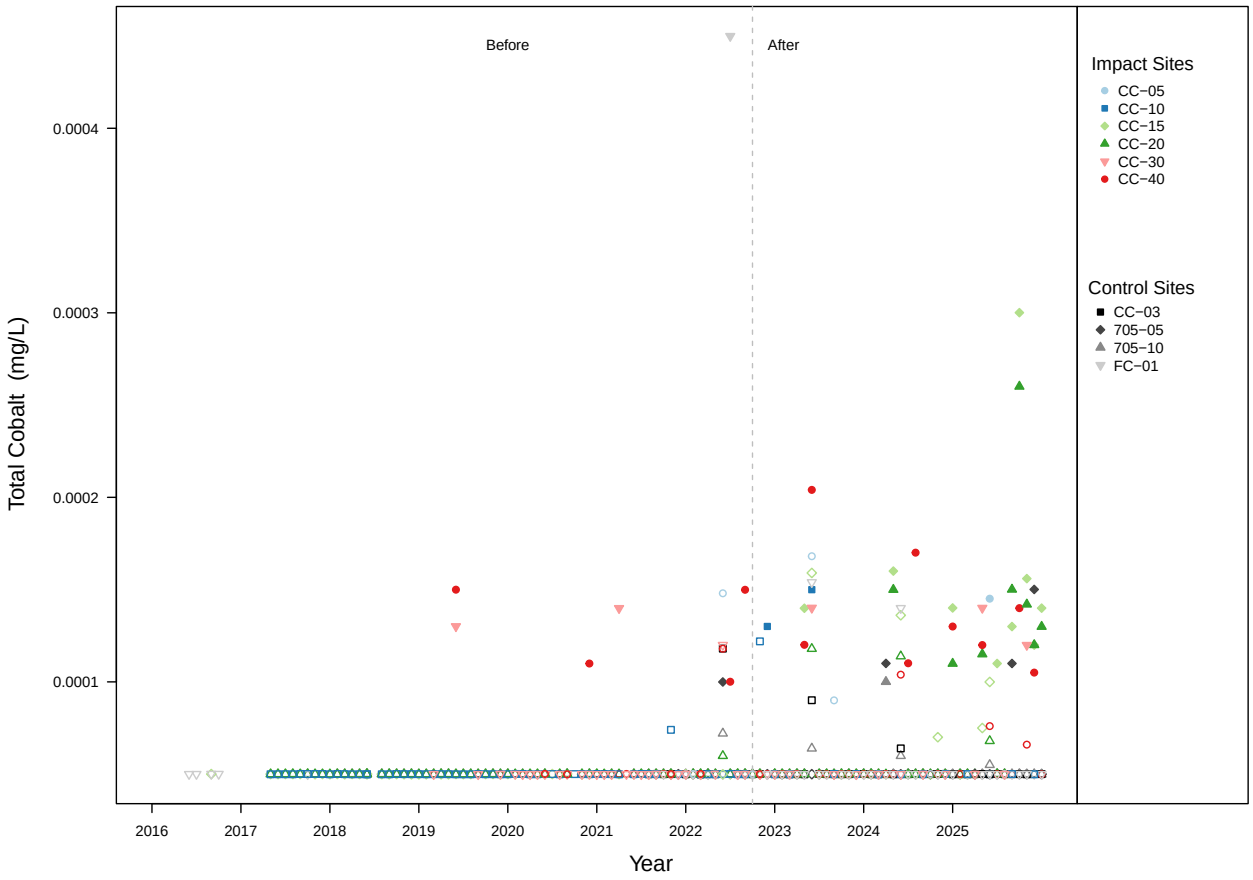
1 Chedakuz Creek

1.1 Censored Data The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Conclusion:

Statistical analyses were not conducted due to censoring or availability of observations. Below is a summary figure of all observations in the dataset.



Note: Open symbols represent cases where the results were below the sample detection limit.

Final Summary Table

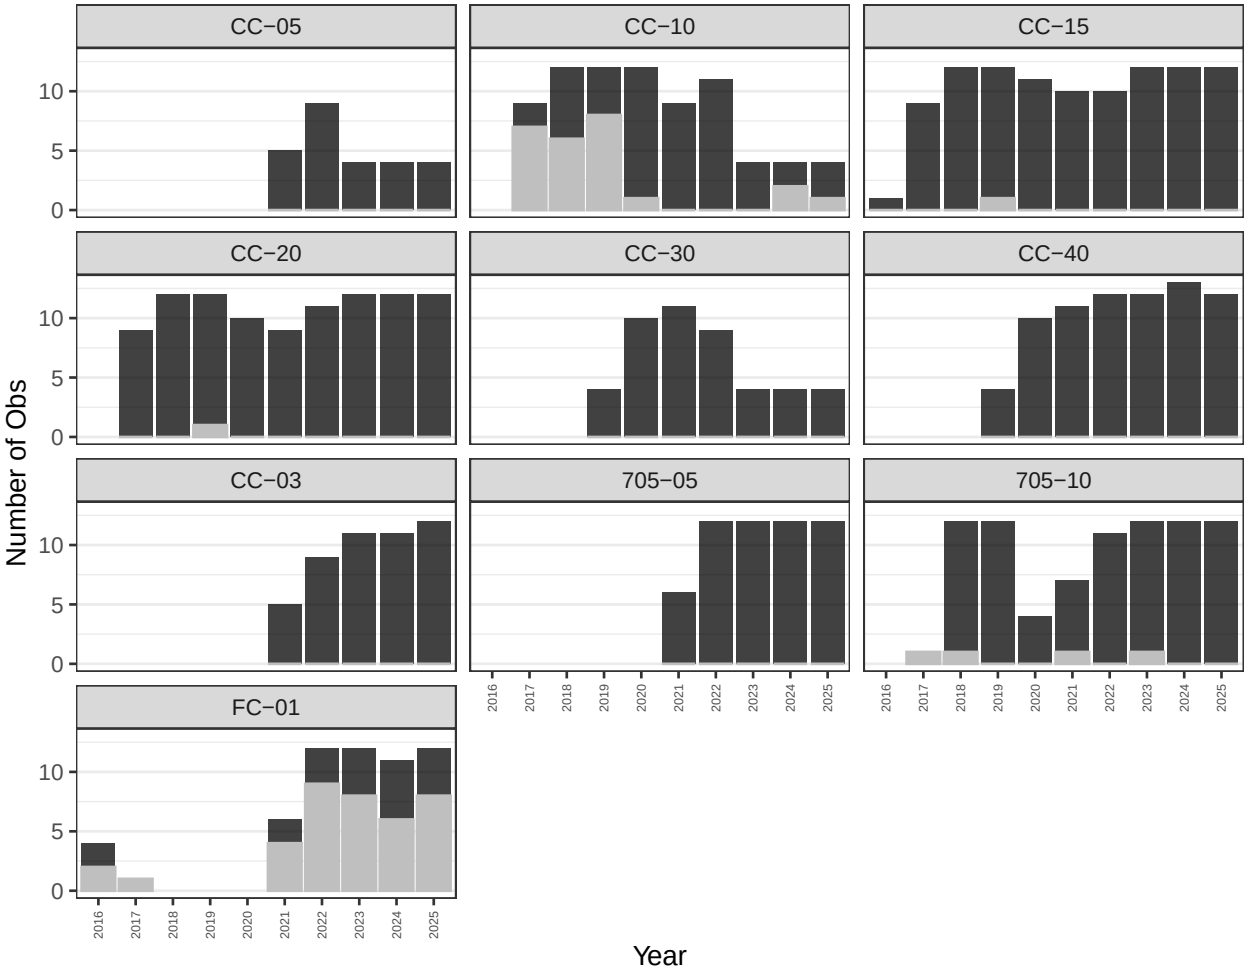
Variable	Total Cobalt
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	All Excluded
Data Transformation	N/A
Model Type	N/A
Benchmark	None
Significant BACI term	N/A

A-12.3.12 Total Iron

1 Chedakuz Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

Watershed	Site	Year	Class	Period	#Obs Removed
Chedakuz Creek	CC-10	2017	impact	before	9
Chedakuz Creek	CC-10	2019	impact	before	12
Creek 705 (Control)	705-10	2017	control	before	1
Fawnie Creek (Control)	FC-01	2017	control	before	1
Fawnie Creek (Control)	FC-01	2021	control	before	6
Fawnie Creek (Control)	FC-01	2022	control	before	12
Fawnie Creek (Control)	FC-01	2022	control	after	12

(Continued on Next Page...)

(continued)

Watershed	Site	Year	Class	Period	#Obs Removed
Fawnie Creek (Control)	FC-01	2023	control	after	12
Fawnie Creek (Control)	FC-01	2024	control	after	11
Fawnie Creek (Control)	FC-01	2025	control	after	12

1.2 Sample Sizes for Modelling

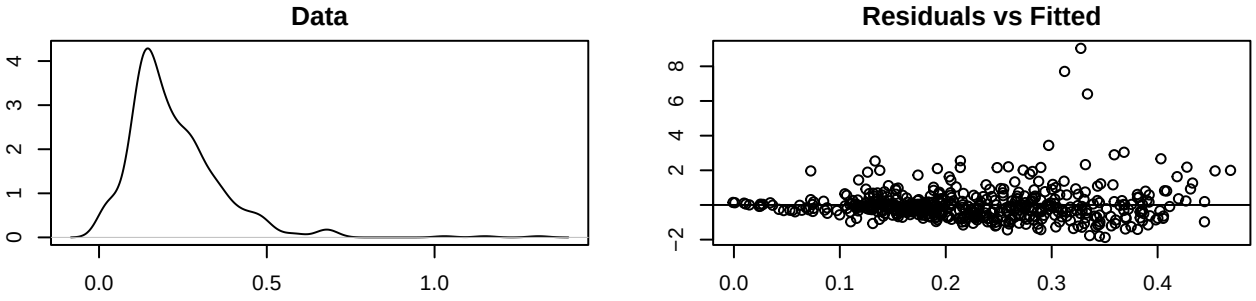
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Chedakuz Creek	CC-05	before	12	0.2285	0.000
Chedakuz Creek	CC-05	after	14	0.1370	0.000
Chedakuz Creek	CC-10	before	24	0.0255	29.167
Chedakuz Creek	CC-15	before	63	0.1460	1.587
Chedakuz Creek	CC-15	after	38	0.2315	0.000
Chedakuz Creek	CC-20	before	61	0.1452	1.639
Chedakuz Creek	CC-20	after	38	0.2023	0.000
Chedakuz Creek	CC-30	before	30	0.2880	0.000
Chedakuz Creek	CC-30	after	16	0.3580	0.000
Chedakuz Creek	CC-40	before	34	0.3000	0.000
Chedakuz Creek	CC-40	after	40	0.3435	0.000
Chedakuz Creek	CC-03	before	12	0.2065	0.000
Chedakuz Creek	CC-03	after	36	0.1395	0.000
Creek 705 (Control)	705-05	before	15	0.2100	0.000
Creek 705 (Control)	705-05	after	39	0.2110	0.000
Creek 705 (Control)	705-10	before	16	0.0940	6.250
Fawnie Creek (Control)	FC-01	before	4	0.0335	50.000

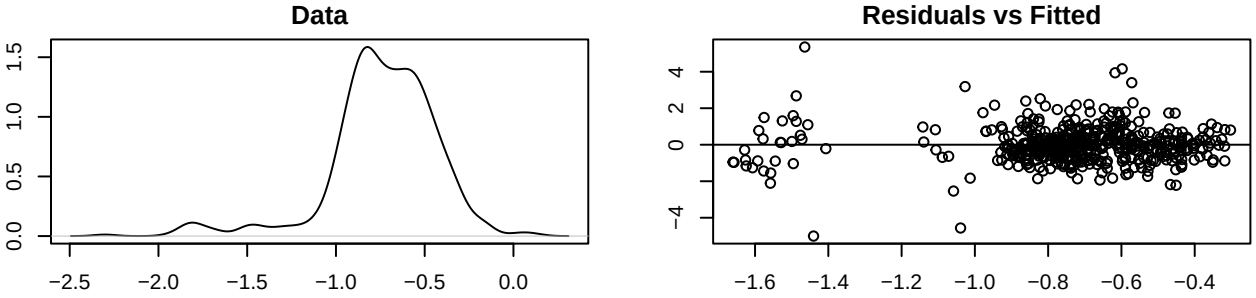
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 705 (Control)	705-05	2025	9	control	after	1.310	0.3275	9.035	Y
Creek 705 (Control)	705-05	2025	8	control	after	1.150	0.3122	7.705	Y
Creek 705 (Control)	705-05	2025	10	control	after	1.030	0.3338	6.403	Y
Chedakuz Creek	CC-30	2021	3	impact	before	0.671	0.2972	3.438	Y
Chedakuz Creek	CC-40	2024	12	impact	after	0.699	0.3684	3.041	Y

Outliers on log scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-10	2020	11	impact	before	-0.5436	-1.4643	5.352	Y
Chedakuz Creek	CC-10	2020	4	impact	before	-2.3010	-1.4403	-5.003	N
Creek 705 (Control)	705-10	2018	9	control	before	-1.8239	-1.0390	-4.563	N
Creek 705 (Control)	705-05	2025	9	control	after	0.1173	-0.5980	4.158	Y
Creek 705 (Control)	705-05	2025	8	control	after	0.0607	-0.6172	3.941	Y

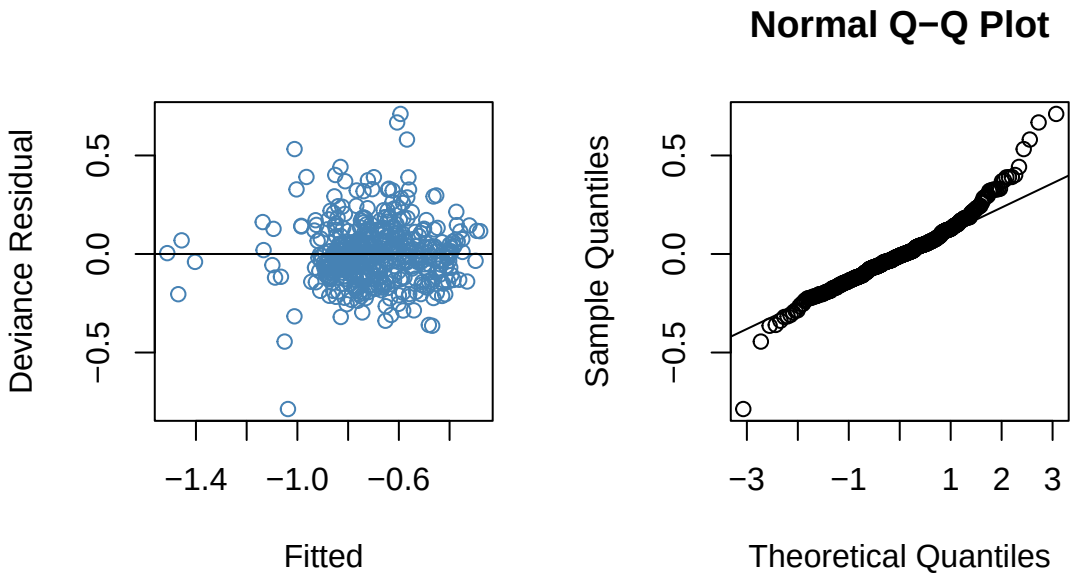
Creek 705 (Control)	705-05	2025	10	control	after	0.0128	-0.5718	3.399	Y
Creek 705 (Control)	705-10	2020	8	control	before	-0.4789	-1.0267	3.185	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.088828	0.088828	1	7.027	3.5361	0.102	
period	0.005374	0.005374	1	22.625	0.2139	0.648	
class:period	0.273185	0.273185	1	441.651	10.8752	0.001	0.00197

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
492	0.2352	100%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (CC-05, CC-15, CC-20, CC-30, CC-40) and control sites (CC-03, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

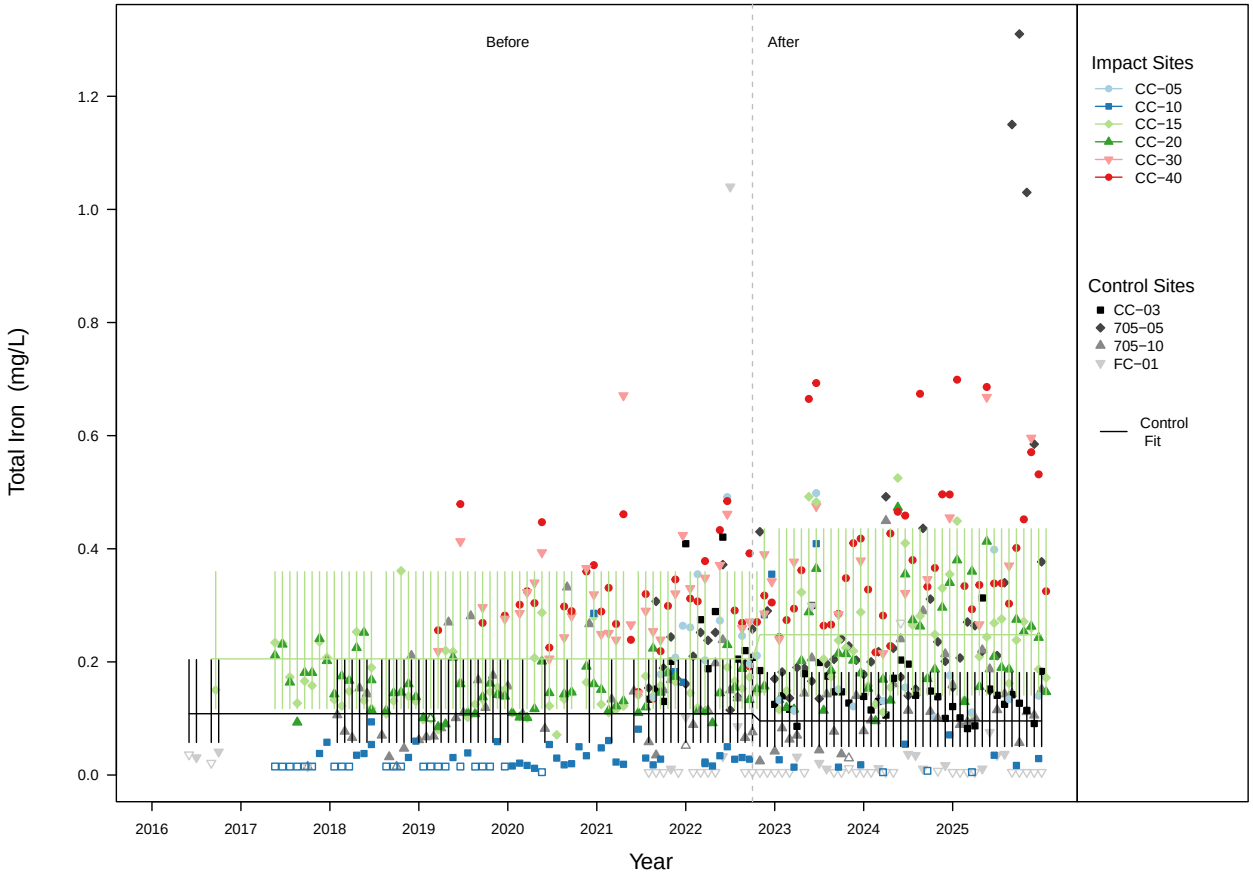
Impact vs.	Estimate	Significance
control sites	0.1366	significant

Conclusion:

The change in Total Iron concentrations at the impact sites from *before* to *after* was significantly (*adjusted p* = 0.002) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

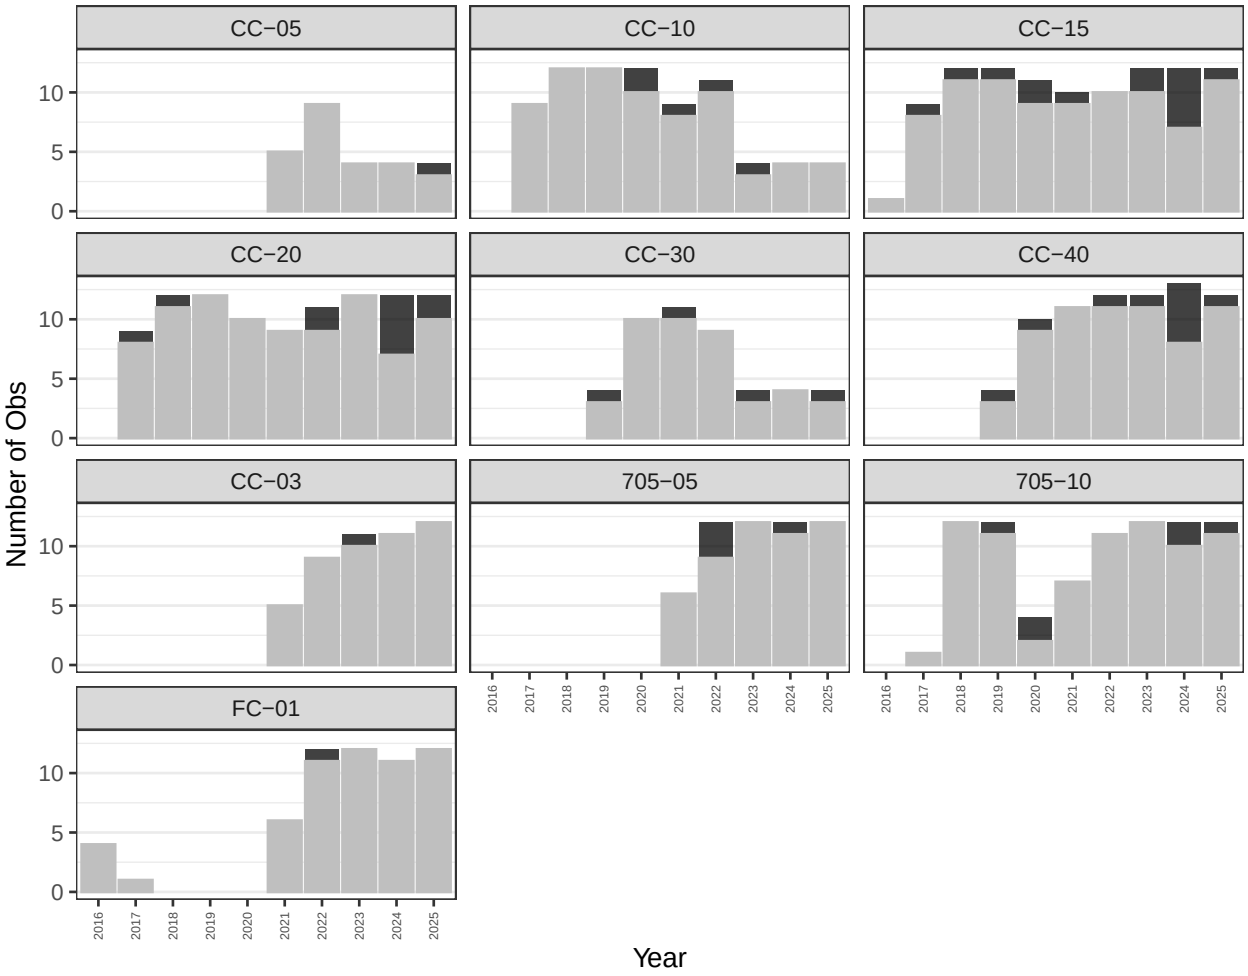
Final Summary Table

Variable	Total Iron
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	CC-10
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	Yes

A-12.3.13 Total Lead

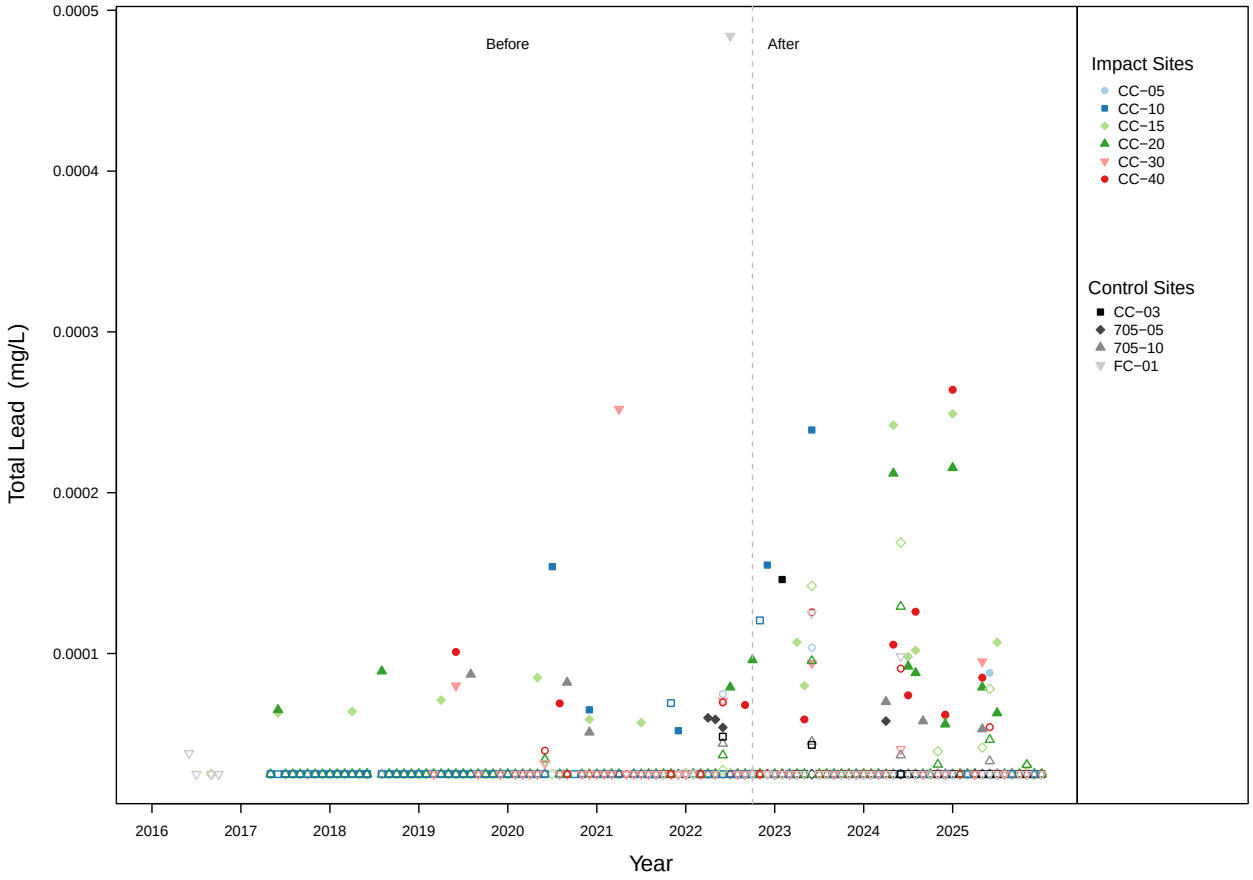
1 Chedakuz Creek

1.1 Censored Data The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Conclusion:

Statistical analyses were not conducted due to censoring or availability of observations. Below is a summary figure of all observations in the dataset.



Note: Open symbols represent cases where the results were below the sample detection limit.

Final Summary Table

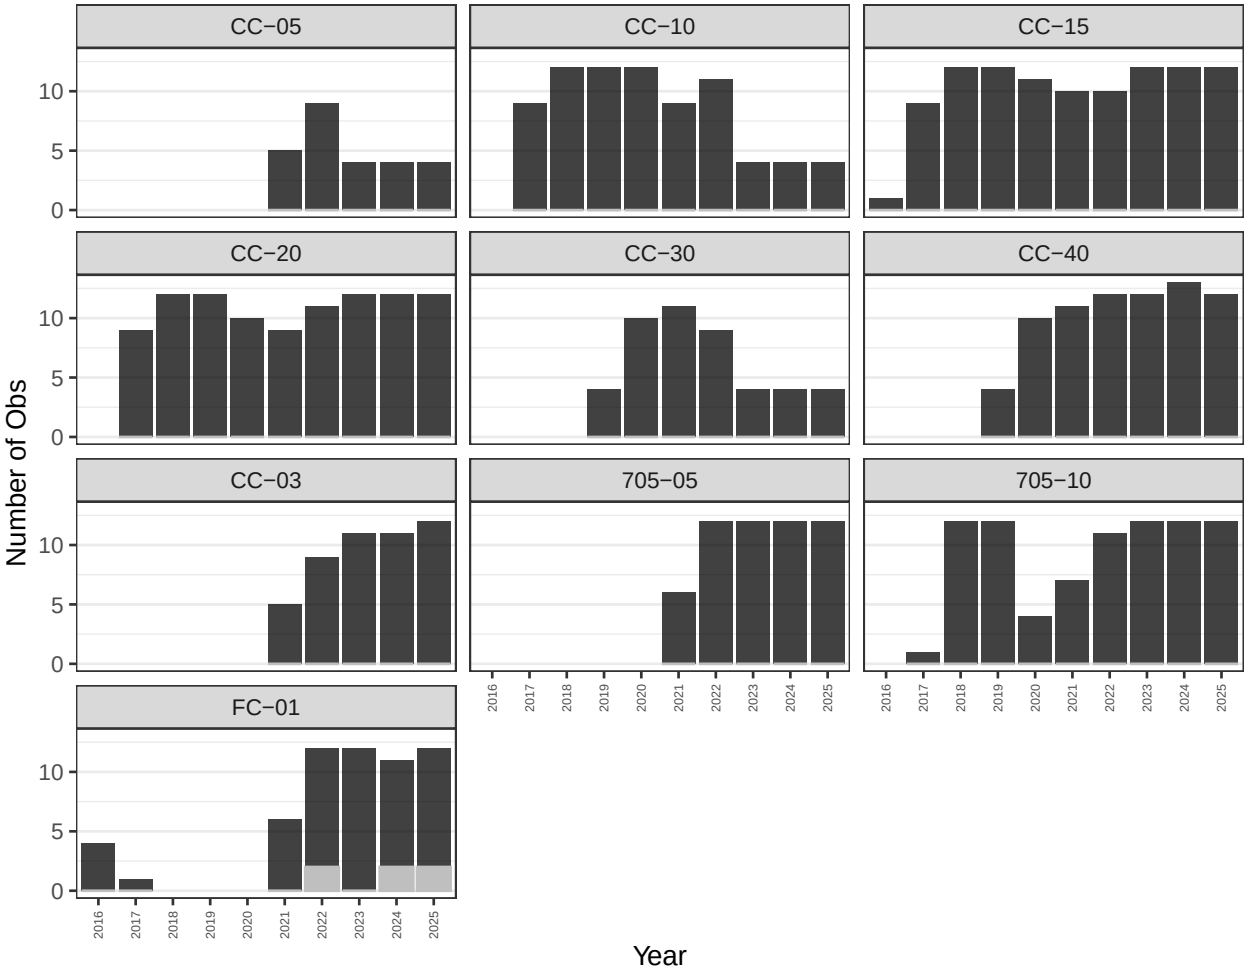
Variable	Total Lead
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	All Excluded
Data Transformation	N/A
Model Type	N/A
Benchmark	None
Significant BACI term	N/A

A-12.3.14 Total Manganese

1 Chedakuz Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

1.2 Sample Sizes for Modelling

The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Chedakuz Creek	CC-05	before	12	0.0427	0.00
Chedakuz Creek	CC-05	after	14	0.0172	0.00
Chedakuz Creek	CC-10	before	62	0.0087	0.00
Chedakuz Creek	CC-10	after	15	0.0163	0.00
Chedakuz Creek	CC-15	before	63	0.0213	0.00
Chedakuz Creek	CC-15	after	38	0.0260	0.00
Chedakuz Creek	CC-20	before	61	0.0241	0.00
Chedakuz Creek	CC-20	after	38	0.0261	0.00
Chedakuz Creek	CC-30	before	30	0.0339	0.00
Chedakuz Creek	CC-30	after	16	0.0385	0.00

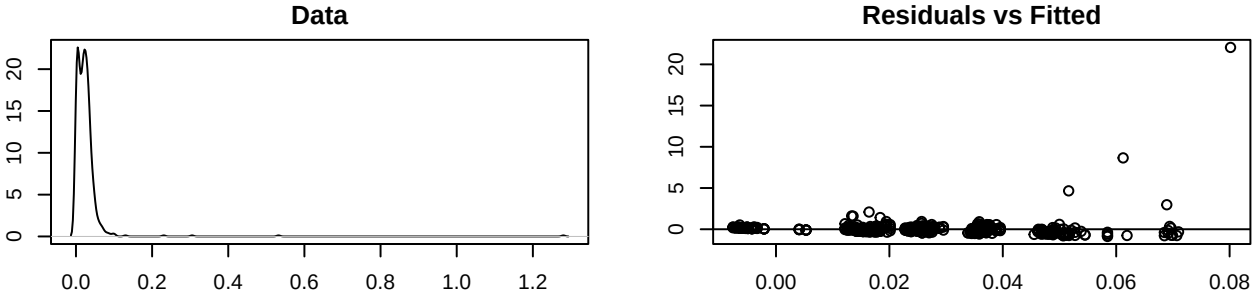
Fawnie Creek (Control)	FC-01	before	20	0.0003	5.00
Fawnie Creek (Control)	FC-01	after	38	0.0003	13.16

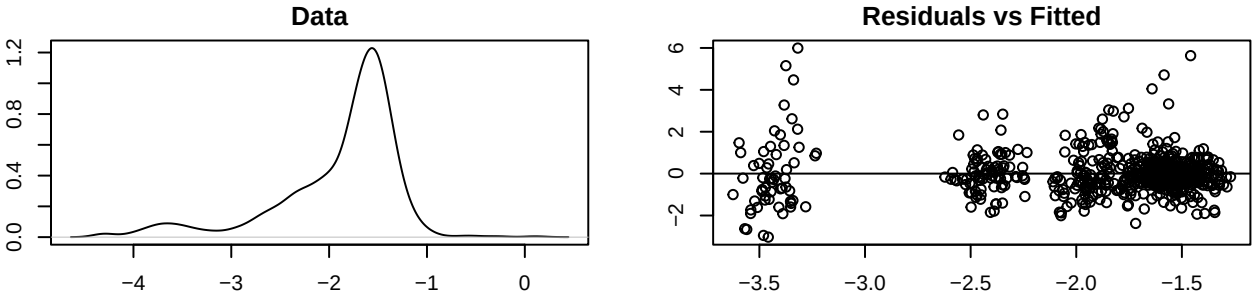
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-03	2021	12	control	before	1.280	0.0802	22.054	Y
Chedakuz Creek	CC-05	2021	12	impact	before	0.532	0.0612	8.653	Y
Chedakuz Creek	CC-05	2022	1	impact	before	0.305	0.0516	4.657	Y

Outliers on log scale:

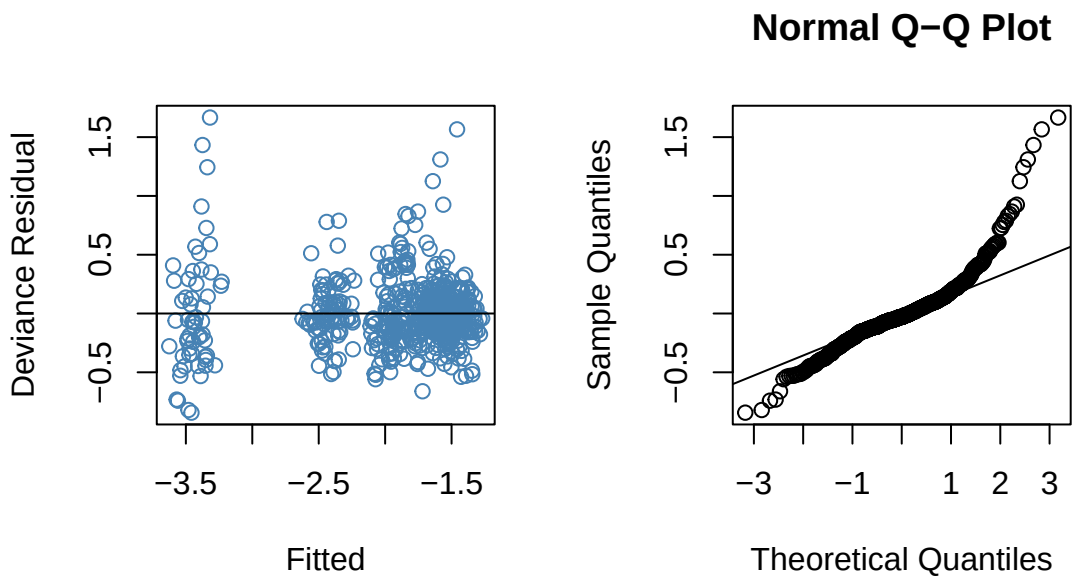
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Fawnie Creek (Control)	FC-01	2022	6	control	before	-1.6517	-3.318	5.993	Y
Chedakuz Creek	CC-03	2021	12	control	before	0.1072	-1.459	5.631	Y
Fawnie Creek (Control)	FC-01	2023	5	control	after	-1.9418	-3.375	5.153	Y
Chedakuz Creek	CC-05	2021	12	impact	before	-0.2741	-1.584	4.711	Y
Fawnie Creek (Control)	FC-01	2024	5	control	after	-2.0945	-3.338	4.473	Y
Chedakuz Creek	CC-05	2022	1	impact	before	-0.5157	-1.641	4.047	Y
Chedakuz Creek	CC-03	2022	2	control	before	-0.6372	-1.563	3.328	Y
Fawnie Creek (Control)	FC-01	2021	12	control	before	-2.4724	-3.383	3.273	Y
Creek 705 (Control)	705-05	2025	11	control	after	-0.8861	-1.753	3.117	Y
Creek 705 (Control)	705-05	2025	10	control	after	-1.0000	-1.846	3.043	Y
Fawnie Creek (Control)	FC-01	2022	3	control	before	-4.3010	-3.458	-3.032	N

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.30141	0.30141	1	8.005	3.898	0.0837	
period	0.09634	0.09634	1	11.884	1.246	0.2860	
class:period	0.71842	0.71842	1	621.001	9.292	0.0024	0.00413

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
666	0.3043	100%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (CC-05, CC-10, CC-15, CC-20, CC-30, CC-40) and control sites (CC-03, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

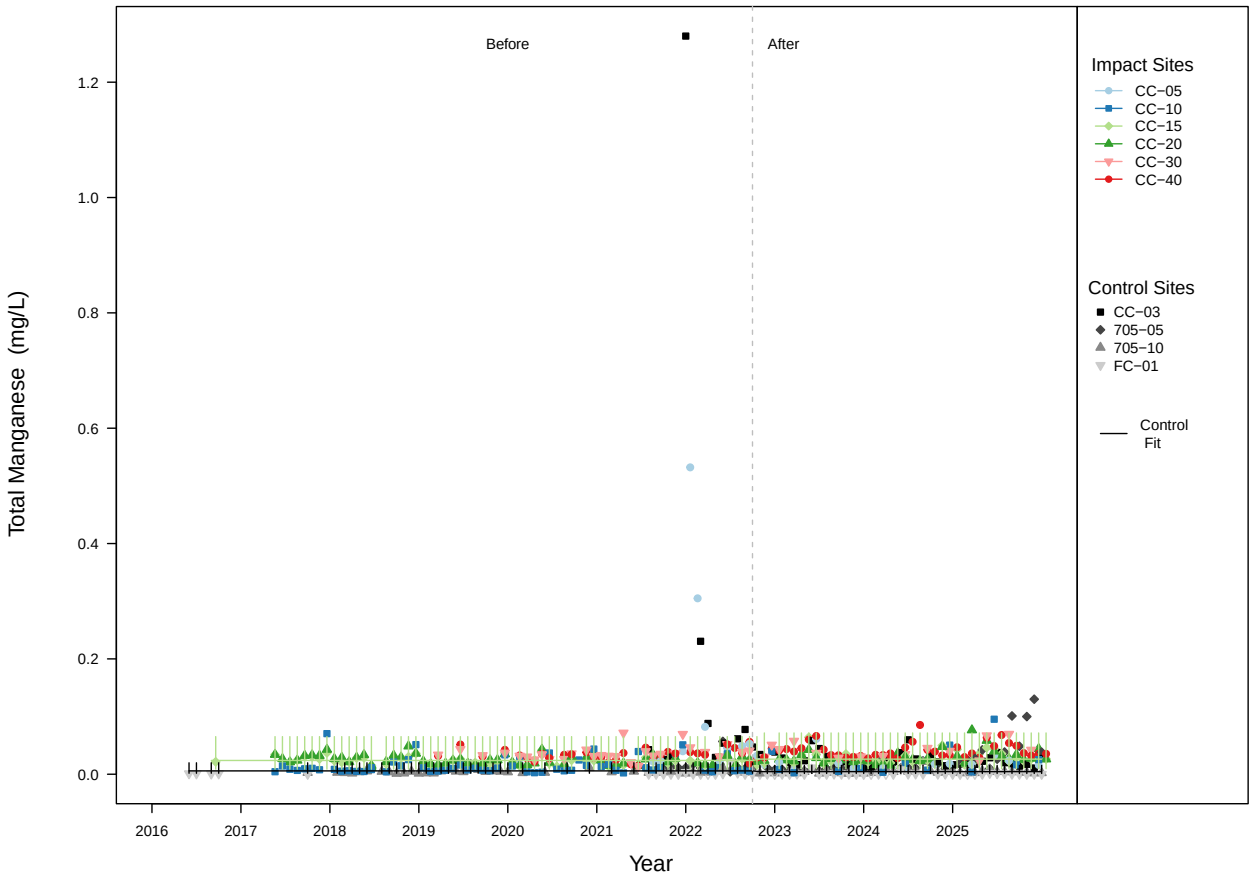
Impact vs.	Estimate	Significance
control sites	0.1483	significant

Conclusion:

The change in Total Manganese concentrations at the impact sites from *before* to *after* was significantly (*adjusted p* = 0.0041) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

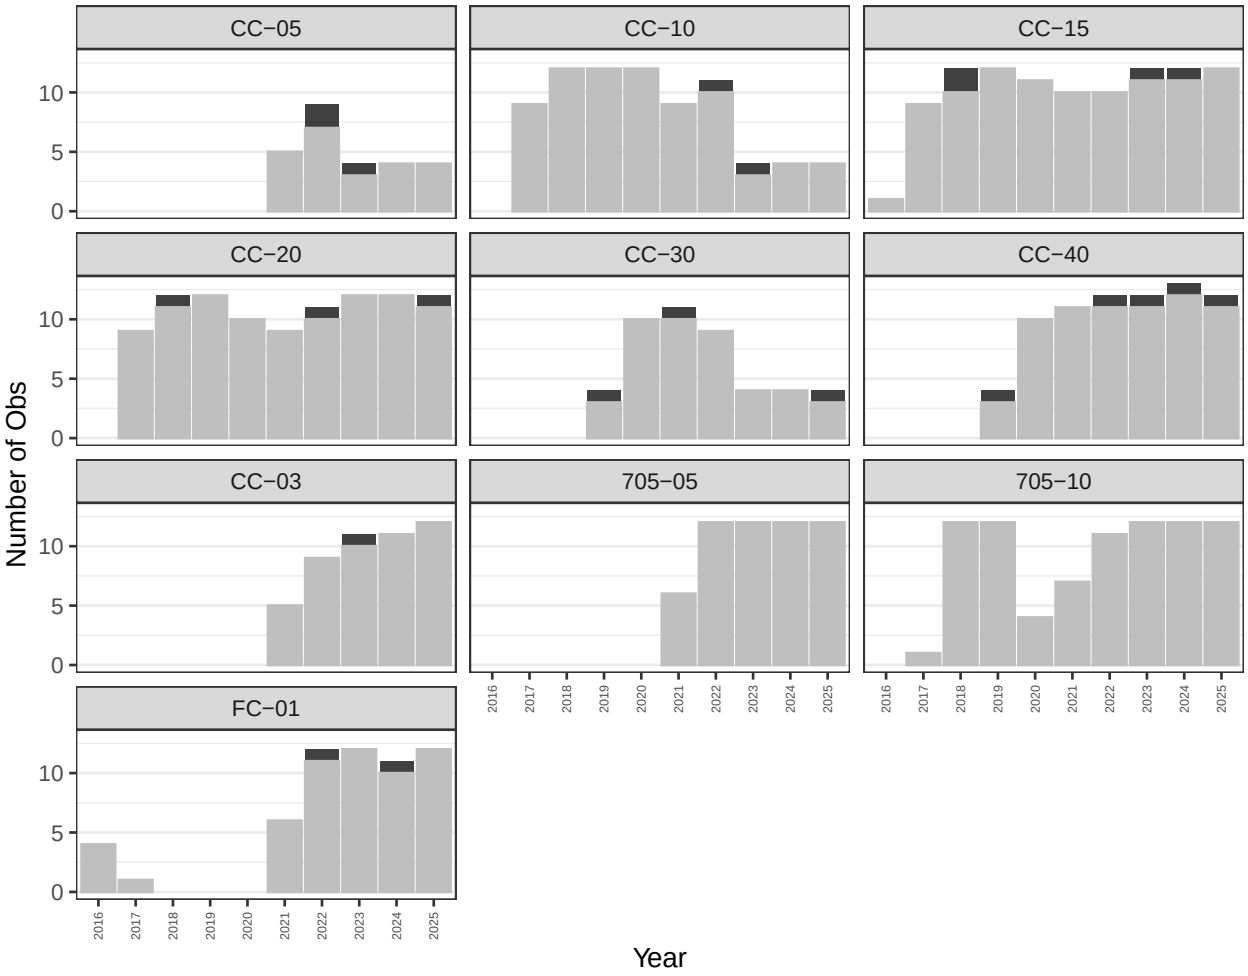
Final Summary Table

Variable	Total Manganese
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	Yes

A-12.3.15 Total Nickel

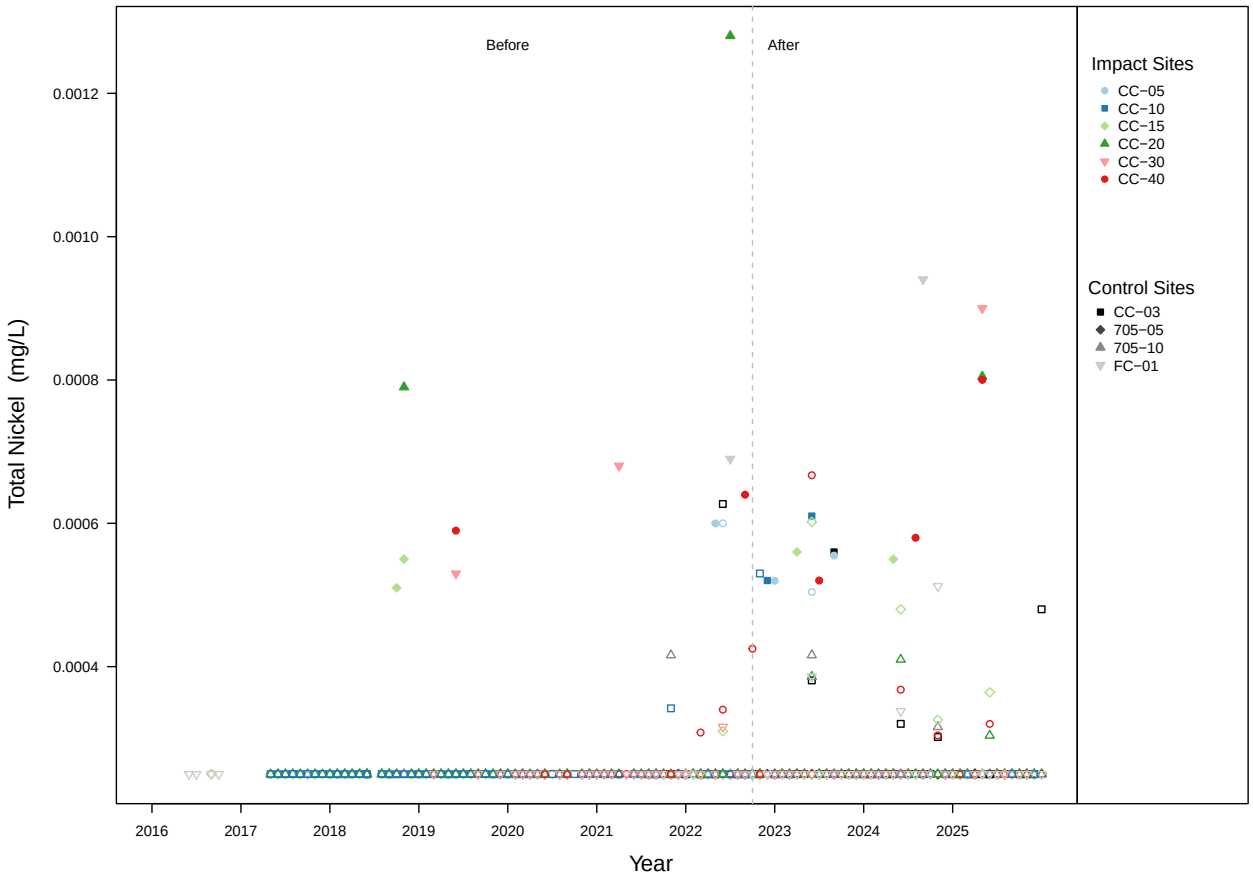
1 Chedakuz Creek

1.1 Censored Data The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Conclusion:

Statistical analyses were not conducted due to censoring or availability of observations. Below is a summary figure of all observations in the dataset.



Note: Open symbols represent cases where the results were below the sample detection limit.

Final Summary Table

Variable	Total Nickel

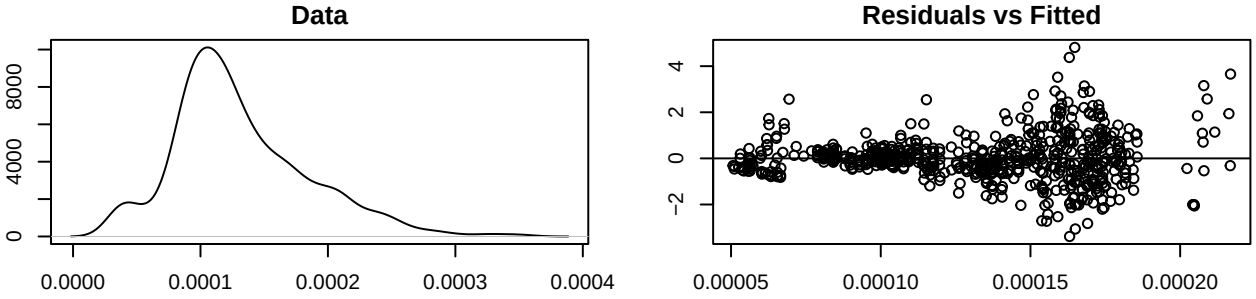
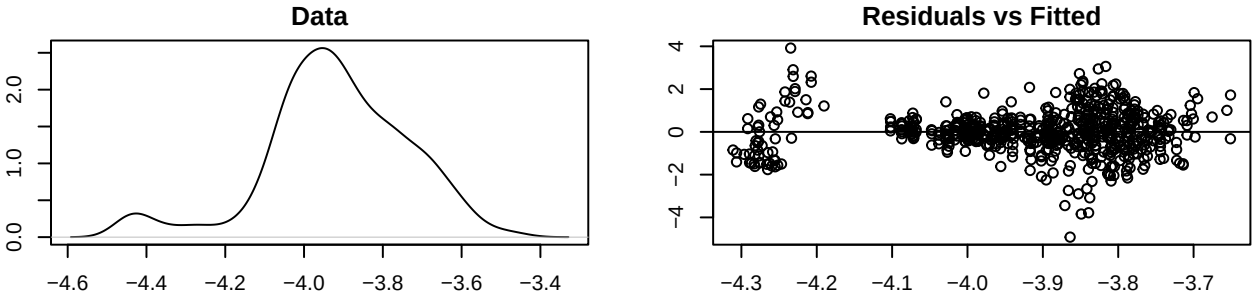
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-03	2024	1	control	after	0.0003	0.0002	4.813	Y
Chedakuz Creek	CC-03	2023	12	control	after	0.0003	0.0002	4.378	Y
Chedakuz Creek	CC-05	2024	2	impact	after	0.0004	0.0002	3.657	Y
Chedakuz Creek	CC-03	2023	10	control	after	0.0003	0.0002	3.521	Y
Chedakuz Creek	CC-03	2022	7	control	before	0.0000	0.0002	-3.386	Y
Chedakuz Creek	CC-05	2023	10	impact	after	0.0003	0.0002	3.156	Y
Chedakuz Creek	CC-03	2024	2	control	after	0.0003	0.0002	3.142	Y
Chedakuz Creek	CC-03	2022	5	control	before	0.0001	0.0002	-3.061	Y

Outliers on log scale:

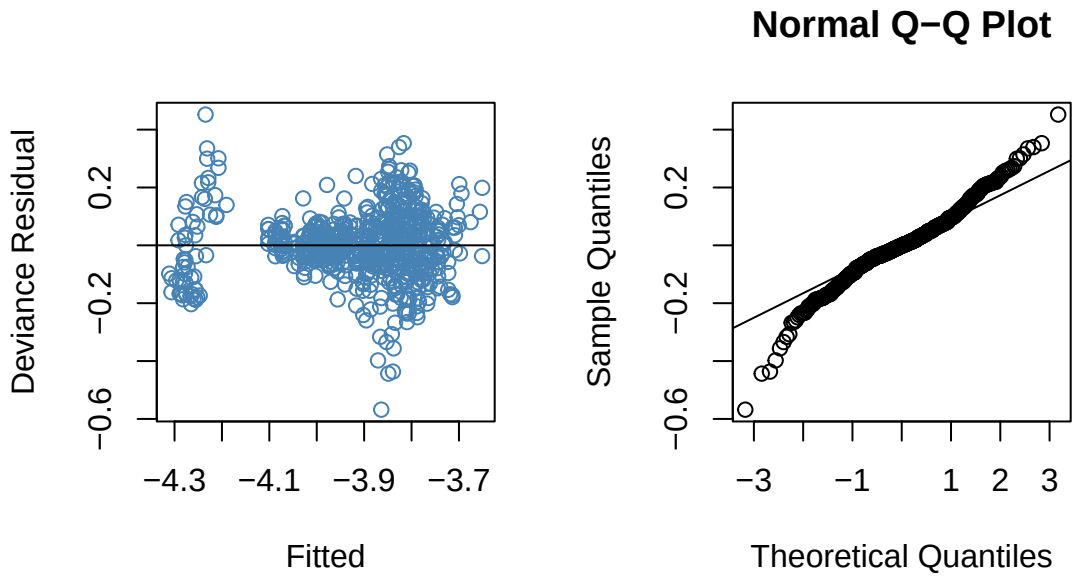
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-03	2022	7	control	before	-4.432	-3.864	-4.922	Y
Fawnie Creek (Control)	FC-01	2021	12	control	before	-3.783	-4.235	3.918	Y
Chedakuz Creek	CC-03	2022	5	control	before	-4.292	-3.849	-3.843	Y
Creek 705 (Control)	705-05	2025	10	control	after	-4.276	-3.839	-3.782	Y
Chedakuz Creek	CC-03	2025	5	control	after	-4.268	-3.871	-3.446	Y
Chedakuz Creek	CC-05	2022	7	impact	before	-4.194	-3.838	-3.086	Y
Chedakuz Creek	CC-03	2024	1	control	after	-3.463	-3.816	3.060	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.002049	0.002049	1	8.009	0.1539	0.705	
period	0.221890	0.221890	1	10.509	16.6656	0.00199	
class:period	0.523451	0.523451	1	580.553	39.3150	<0.001	4.33e-09

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
666	0.0509	17%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (CC-05, CC-10, CC-15, CC-20, CC-30, CC-40) and control sites (CC-03, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

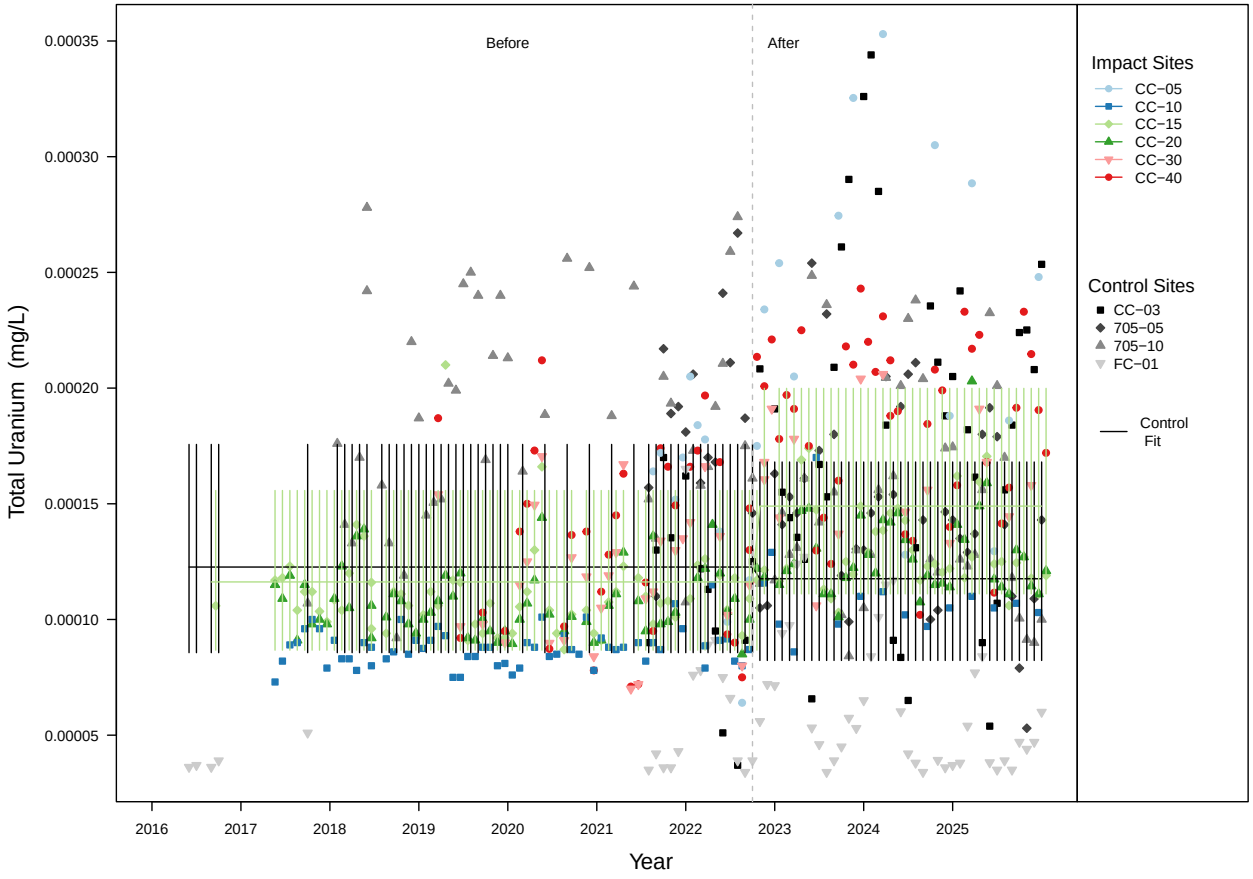
Impact vs.	Estimate	Significance
control sites	0.1261	significant

Conclusion:

The change in Total Uranium concentrations at the impact sites from *before* to *after* was significantly (*adjusted p =* 4.33×10^{-9}) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

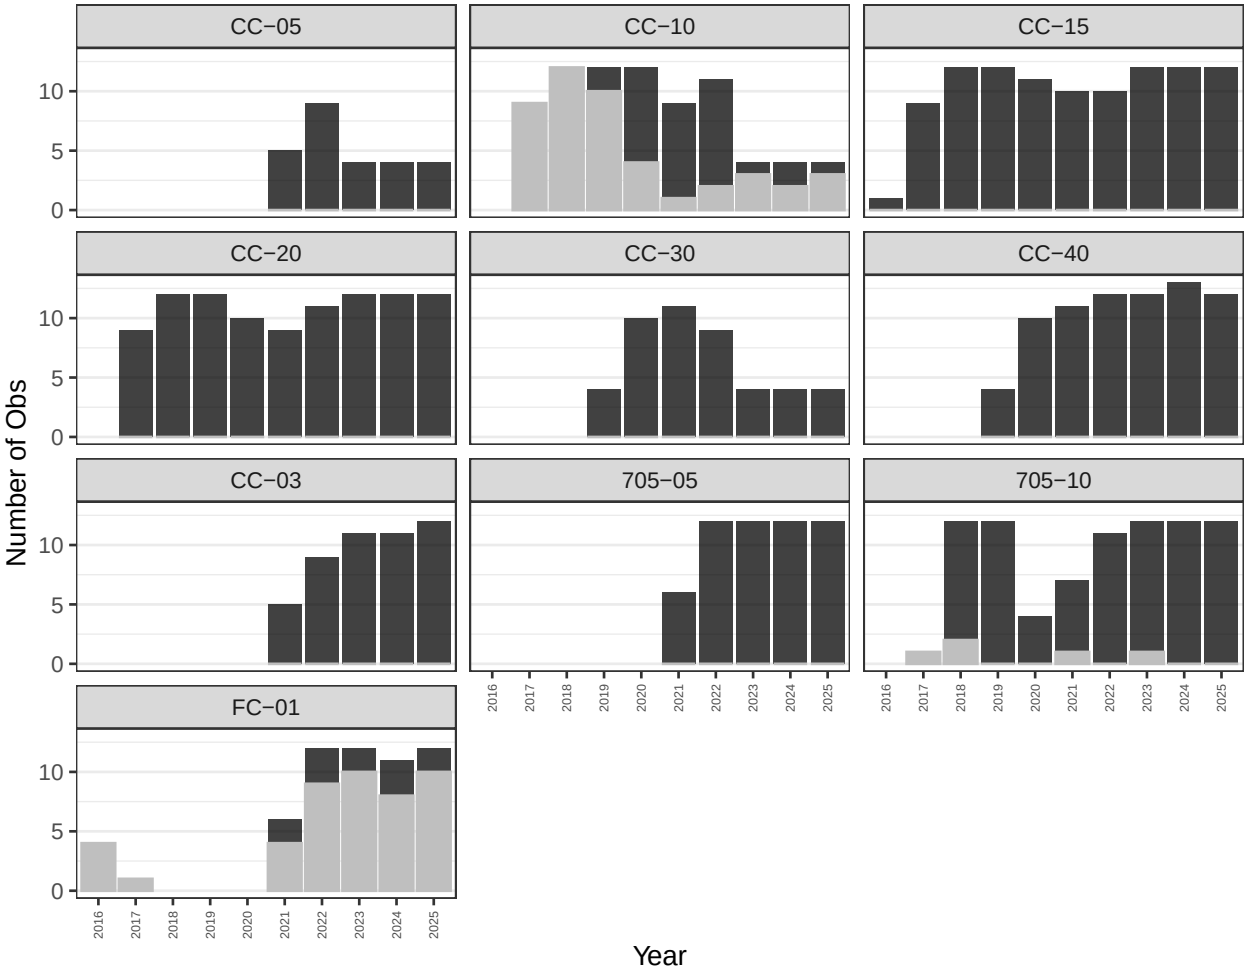
Variable	Total Uranium
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	Yes

A-12.3.17 Dissolved Iron

1 Chedakuz Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

Watershed	Site	Year	Class	Period	#Obs Removed
Chedakuz Creek	CC-10	2017	impact	before	9
Chedakuz Creek	CC-10	2018	impact	before	12
Chedakuz Creek	CC-10	2019	impact	before	12
Chedakuz Creek	CC-10	2023	impact	after	4
Chedakuz Creek	CC-10	2025	impact	after	4
Creek 705 (Control)	705-10	2017	control	before	1
Fawnie Creek (Control)	FC-01	2016	control	before	4

(Continued on Next Page...)

(continued)

Watershed	Site	Year	Class	Period	#Obs Removed
Fawnie Creek (Control)	FC-01	2017	control	before	1
Fawnie Creek (Control)	FC-01	2021	control	before	6
Fawnie Creek (Control)	FC-01	2022	control	before	12
Fawnie Creek (Control)	FC-01	2022	control	after	12
Fawnie Creek (Control)	FC-01	2023	control	after	12
Fawnie Creek (Control)	FC-01	2024	control	after	11
Fawnie Creek (Control)	FC-01	2025	control	after	12

1.2 Sample Sizes for Modelling

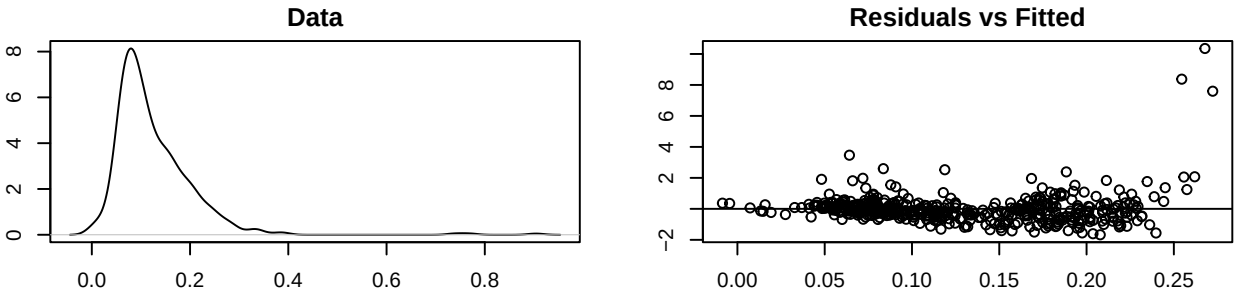
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Chedakuz Creek	CC-05	before	12	0.1245	0.00
Chedakuz Creek	CC-05	after	14	0.0795	0.00
Chedakuz Creek	CC-10	before	12	0.0125	33.33
Chedakuz Creek	CC-15	before	63	0.0770	0.00
Chedakuz Creek	CC-15	after	38	0.0895	0.00
Chedakuz Creek	CC-20	before	61	0.0760	0.00
Chedakuz Creek	CC-20	after	38	0.0963	0.00
Chedakuz Creek	CC-30	before	30	0.1620	0.00
Chedakuz Creek	CC-30	after	16	0.2080	0.00
Chedakuz Creek	CC-40	before	34	0.1710	0.00
Chedakuz Creek	CC-40	after	40	0.1980	0.00
Chedakuz Creek	CC-03	before	12	0.1121	0.00
Chedakuz Creek	CC-03	after	36	0.0790	0.00
Creek 705 (Control)	705-05	before	15	0.1480	0.00
Creek 705 (Control)	705-05	after	39	0.1590	0.00
Creek 705 (Control)	705-10	before	4	0.1065	0.00

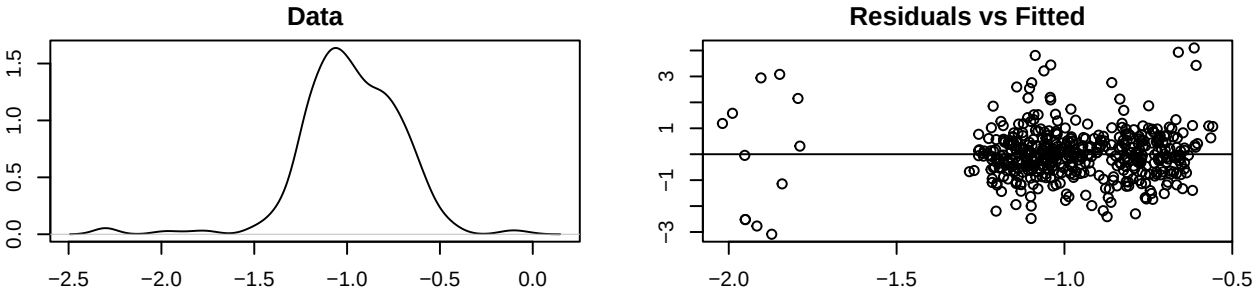
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 705 (Control)	705-05	2025	9	control	after	0.904	0.2678	10.354	Y
Creek 705 (Control)	705-05	2025	8	control	after	0.769	0.2545	8.373	Y
Creek 705 (Control)	705-05	2025	10	control	after	0.739	0.2723	7.596	Y
Chedakuz Creek	CC-03	2021	12	control	before	0.277	0.0642	3.464	Y

Outliers on log scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 705 (Control)	705-05	2025	9	control	after	-0.0438	-0.6135	4.098	Y
Creek 705 (Control)	705-05	2025	8	control	after	-0.1141	-0.6607	3.932	Y
Chedakuz Creek	CC-03	2021	12	control	before	-0.5575	-1.0870	3.809	Y
Chedakuz Creek	CC-20	2025	2	impact	after	-0.5622	-1.0407	3.442	Y
Creek 705 (Control)	705-05	2025	10	control	after	-0.1314	-0.6077	3.427	Y
Chedakuz Creek	CC-05	2022	1	impact	before	-0.6144	-1.0610	3.213	Y
Chedakuz Creek	CC-10	2020	4	impact	before	-2.3010	-1.8721	-3.086	N

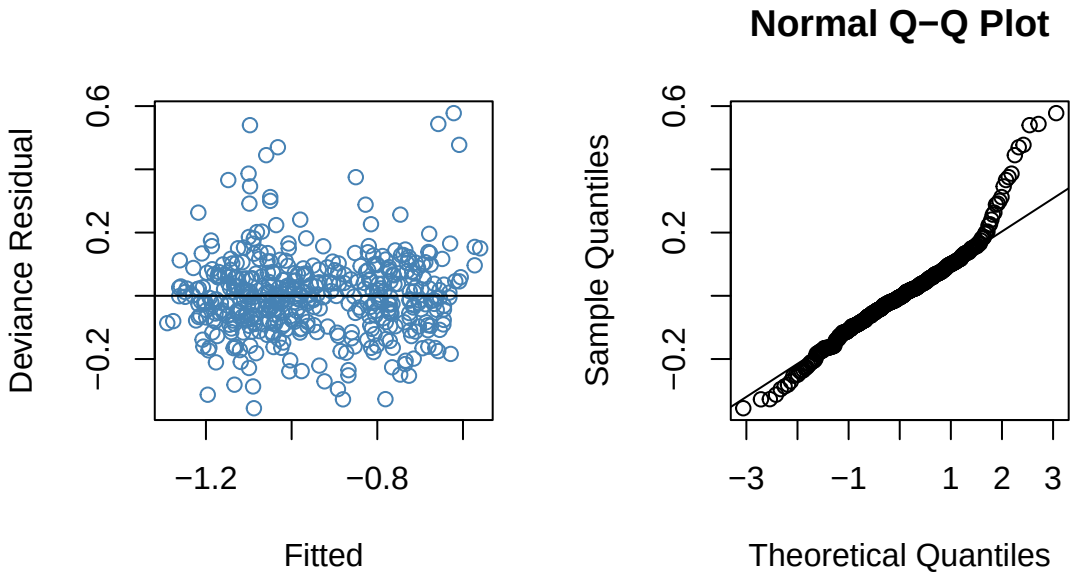
Chedakuz Creek	CC-10	2020	11	impact	before	-1.4202	-1.8483	3.079	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.000107	0.000107	1	6.096	0.0063	0.9390	
period	0.0168397	0.0168397	1	47.243	0.9833	0.3260	
class:period	0.0628086	0.0628086	1	437.298	3.6675	0.0561	0.0731

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
464	0.0056	5%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (CC-05, CC-15, CC-20, CC-30, CC-40) and control sites (CC-03, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

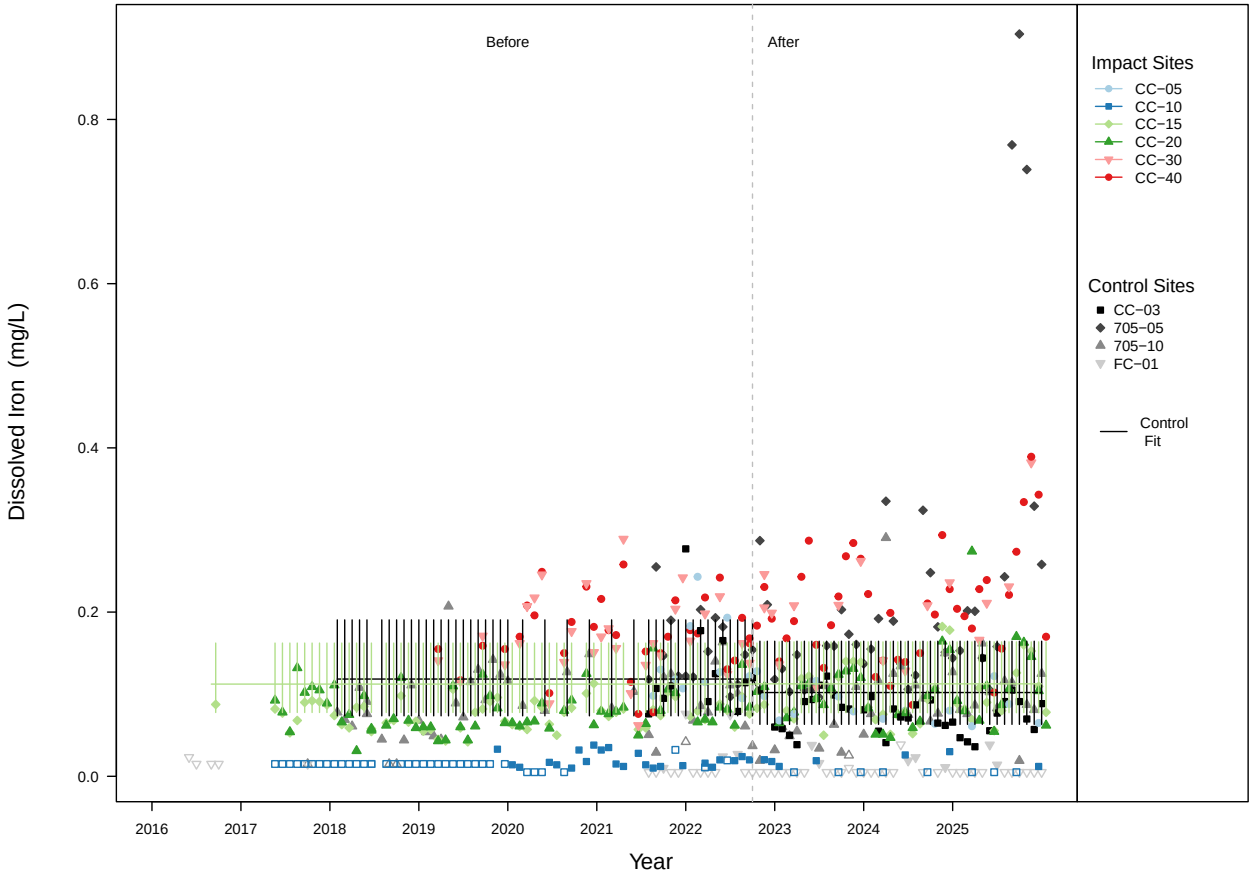
Impact vs.	Estimate	Significance
control sites	0.0661	not significant

Conclusion:

The change in Dissolved Iron concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.0731) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

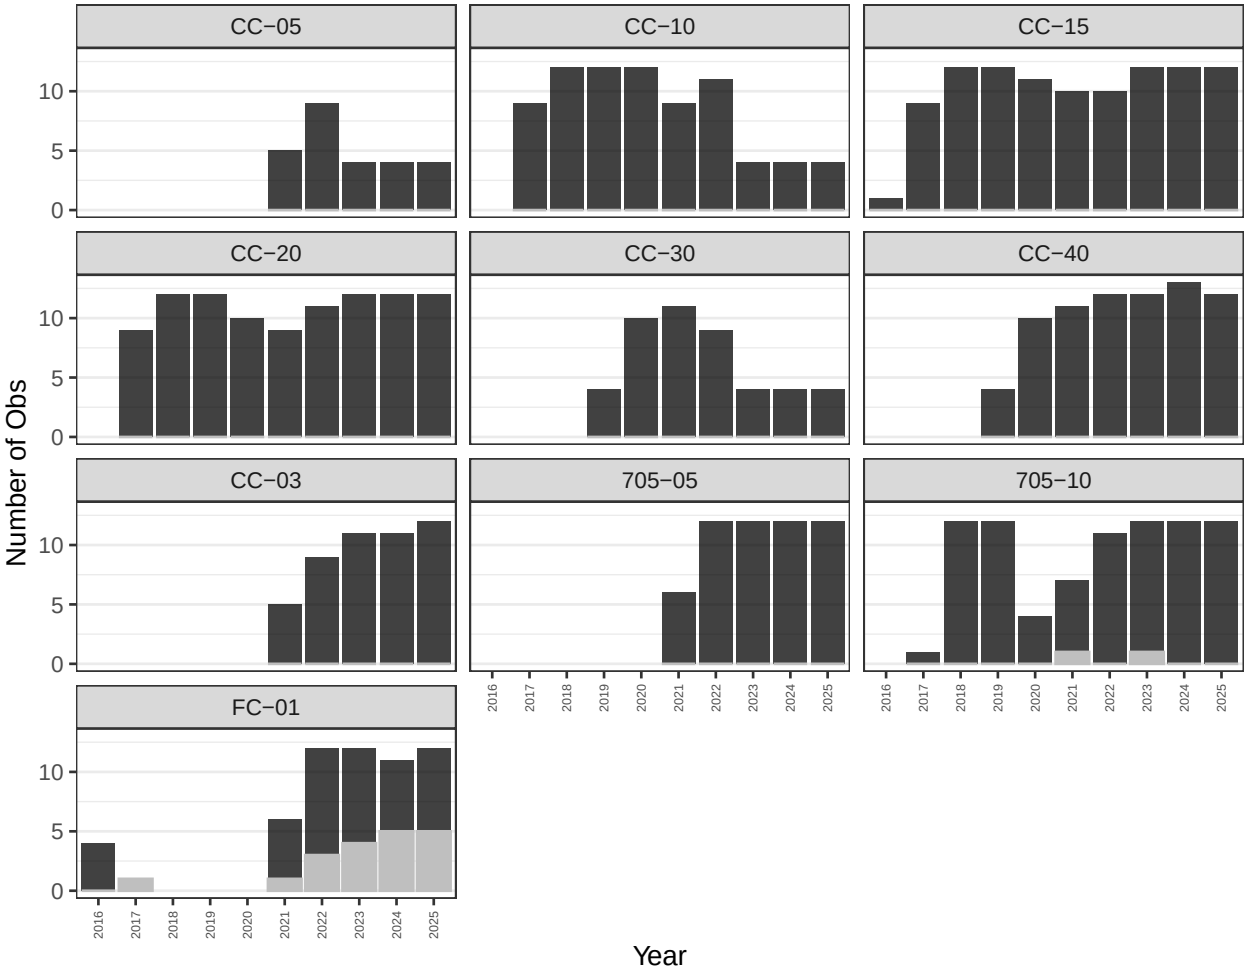
Variable	Dissolved Iron
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	FC-01, CC-10
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

A-12.3.18 Dissolved Manganese

1 Chedakuz Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

Watershed	Site	Year	Class	Period	#Obs Removed
Fawnie Creek (Control)	FC-01	2017	control	before	1

1.2 Sample Sizes for Modelling

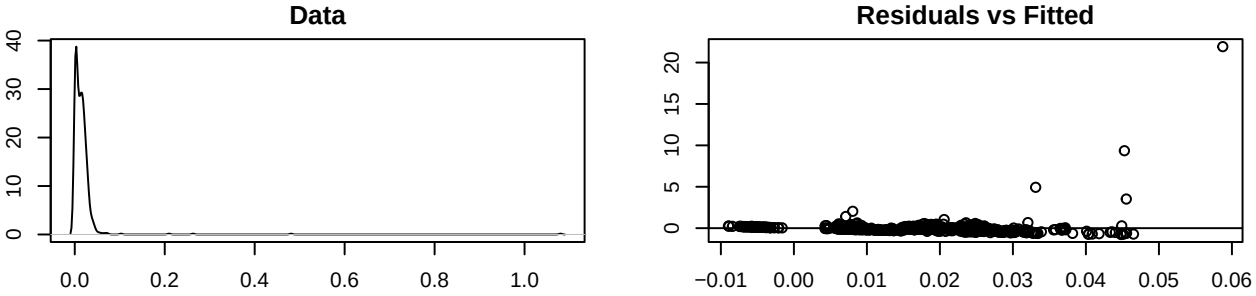
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Chedakuz Creek	CC-05	before	12	0.0124	0.000
Chedakuz Creek	CC-05	after	14	0.0066	0.000
Chedakuz Creek	CC-10	before	62	0.0033	0.000
Chedakuz Creek	CC-10	after	15	0.0033	0.000
Chedakuz Creek	CC-15	before	63	0.0138	0.000
Chedakuz Creek	CC-15	after	38	0.0186	0.000
Chedakuz Creek	CC-20	before	61	0.0165	0.000
Chedakuz Creek	CC-20	after	38	0.0198	0.000
Chedakuz Creek	CC-30	before	30	0.0229	0.000
Chedakuz Creek	CC-30	after	16	0.0282	0.000
Chedakuz Creek	CC-40	before	34	0.0211	0.000
Chedakuz Creek	CC-40	after	40	0.0282	0.000
Chedakuz Creek	CC-03	before	12	0.0186	0.000
Chedakuz Creek	CC-03	after	36	0.0097	0.000
Creek 705 (Control)	705-05	before	15	0.0071	0.000
Creek 705 (Control)	705-05	after	39	0.0091	0.000
Creek 705 (Control)	705-10	before	45	0.0020	2.222
Creek 705 (Control)	705-10	after	38	0.0019	2.632
Fawnie Creek (Control)	FC-01	before	19	0.0002	15.790
Fawnie Creek (Control)	FC-01	after	38	0.0001	39.474

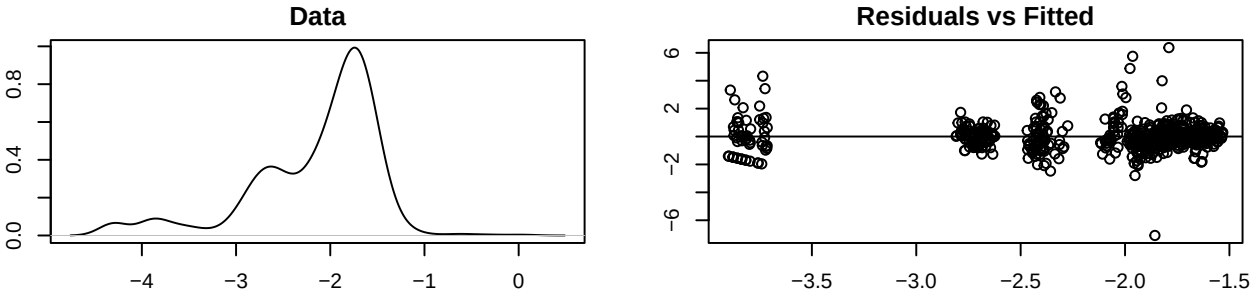
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-03	2021	12	control	before	1.0800	0.0587	21.921	Y
Chedakuz Creek	CC-05	2021	12	impact	before	0.4810	0.0453	9.353	Y
Chedakuz Creek	CC-05	2022	1	impact	before	0.2630	0.0331	4.934	Y
Chedakuz Creek	CC-03	2022	2	control	before	0.2094	0.0455	3.518	Y

Outliers on log scale:

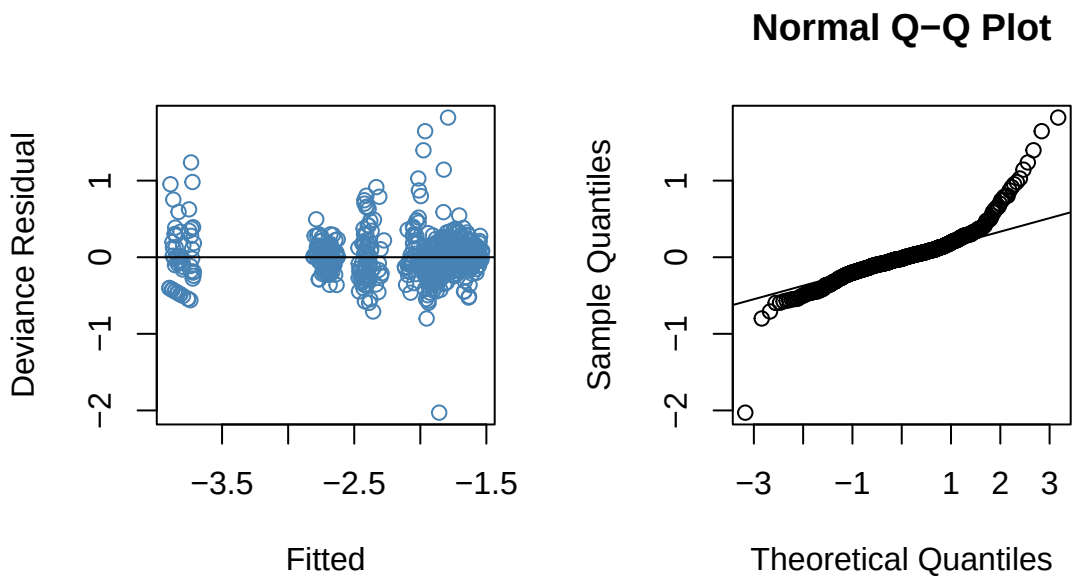
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Chedakuz Creek	CC-20	2018	3	impact	before	-3.8861	-1.857	-7.090	Y
Chedakuz Creek	CC-03	2021	12	control	before	0.0334	-1.790	6.371	Y
Chedakuz Creek	CC-05	2021	12	impact	before	-0.3179	-1.963	5.750	Y
Chedakuz Creek	CC-05	2022	1	impact	before	-0.5800	-1.976	4.879	Y
Fawnie Creek (Control)	FC-01	2022	6	control	before	-2.4976	-3.735	4.324	Y
Chedakuz Creek	CC-03	2022	2	control	before	-0.6790	-1.822	3.995	Y
Creek 705 (Control)	705-05	2025	10	control	after	-0.9872	-2.015	3.592	Y
Fawnie Creek (Control)	FC-01	2021	12	control	before	-2.7423	-3.724	3.431	Y
Fawnie Creek (Control)	FC-01	2023	5	control	after	-2.9378	-3.890	3.329	Y
Chedakuz Creek	CC-10	2024	11	impact	after	-1.4179	-2.333	3.197	Y
Creek 705 (Control)	705-05	2025	8	control	after	-1.1385	-2.010	3.047	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.31956	0.31956	1	8.004	3.9015	0.0836	
period	0.01354	0.01354	1	13.763	0.1653	0.691	
class:period	0.94826	0.94826	1	633.129	11.5772	<0.001	0.00139

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
665	0.3109	100%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (CC-05, CC-10, CC-15, CC-20, CC-30, CC-40) and control sites (CC-03, 705-05, 705-10, FC-01), with p value adjusted for multiple comparisons:

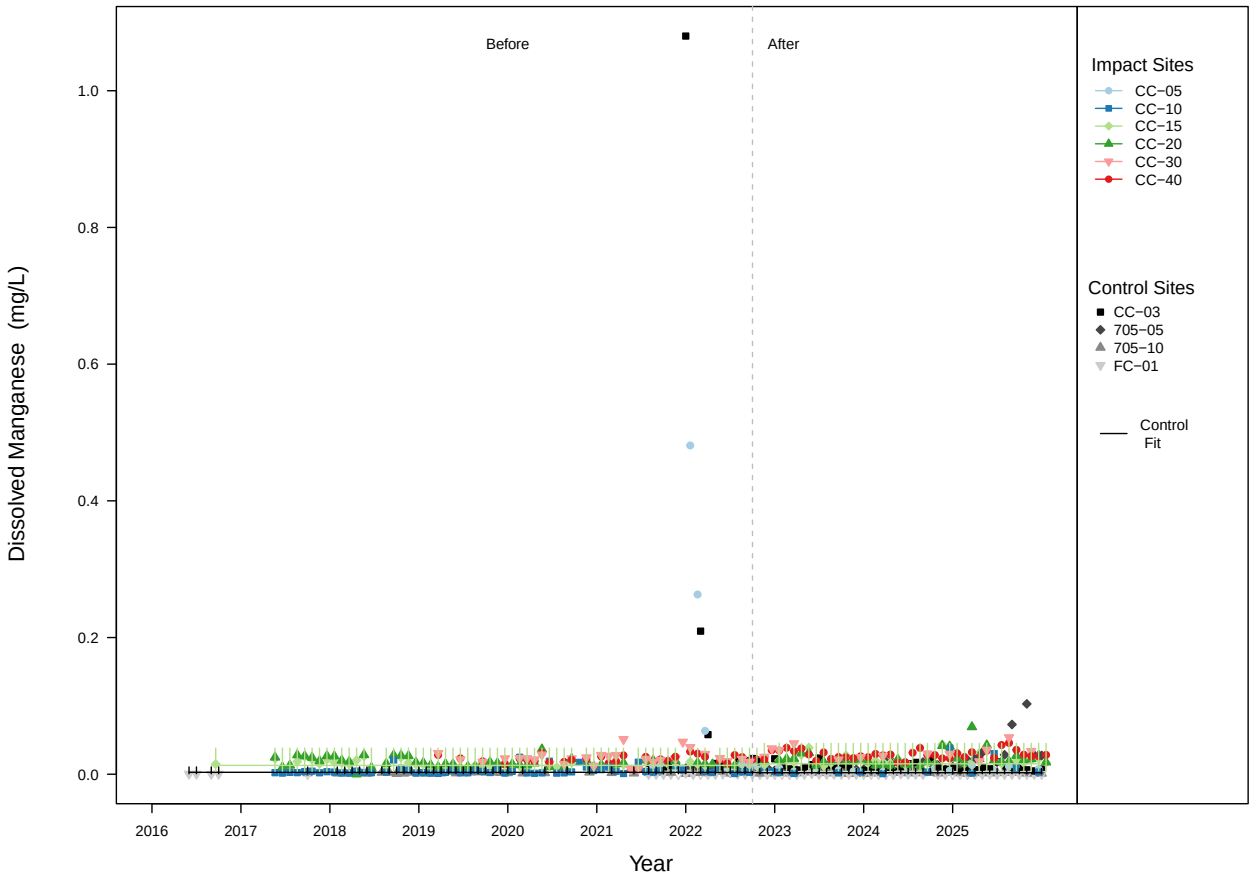
Impact vs.	Estimate	Significance
control sites	0.171	significant

Conclusion:

The change in Dissolved Manganese concentrations at the impact sites from *before* to *after* was significantly (*adjusted p* = 0.0014) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

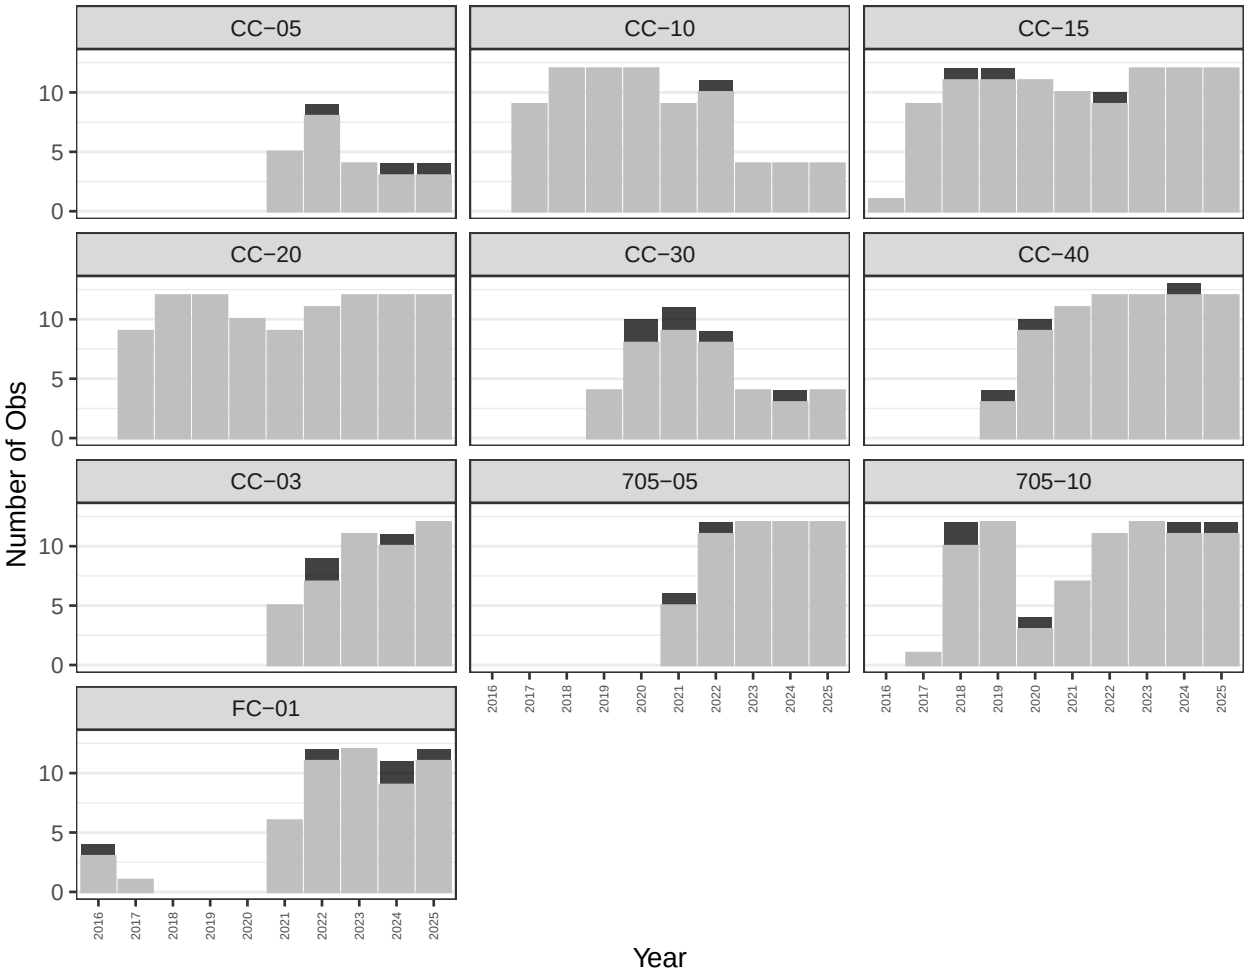
Final Summary Table

Variable	Dissolved Manganese
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	Yes

A-12.3.19 Dissolved Zinc

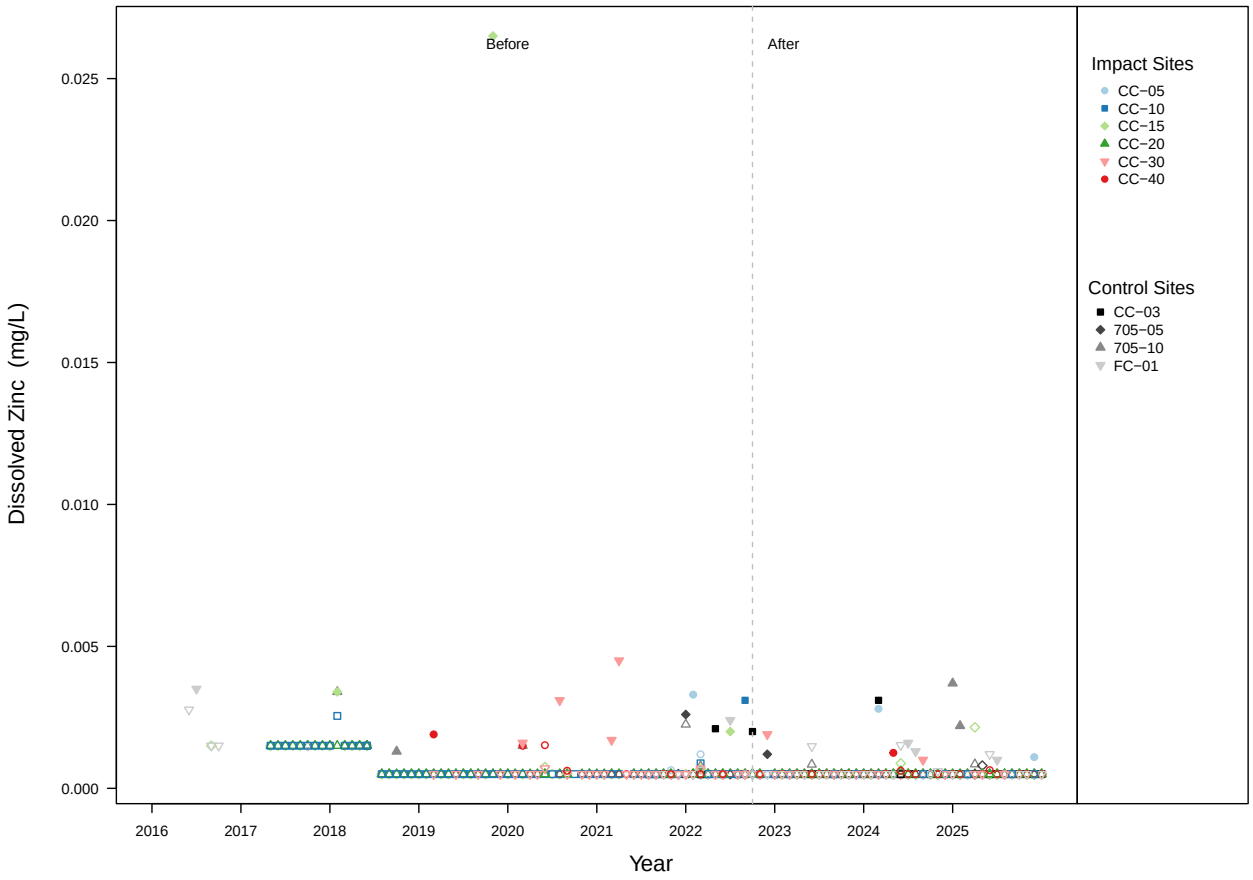
1 Chedakuz Creek

1.1 Censored Data The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Conclusion:

Statistical analyses were not conducted due to censoring or availability of observations. Below is a summary figure of all observations in the dataset.



Note: Open symbols represent cases where the results were below the sample detection limit.

Final Summary Table

Variable	Dissolved Zinc
Watershed	Chedakuz Creek
Waterbody	Stream
Streams Removed	All Excluded
Data Transformation	N/A
Model Type	N/A
Benchmark	None
Significant BACI term	N/A

Notes:
Concentrations in mg/L (unless otherwise noted).
Shaded cells indicate the mean monthly concentration is greater than the predicted concentration for that month.
Values below detection limit were replaced with half the detection limit for calculations.

[a] Maximum monthly base case (95th percentile) predicted concentration predicted in base case in Construction and Operations phases at WQ28 in the water quality prediction model v.13e (Lorax 2022).
[b] Mean monthly concentration October 2022 to December 2025, Construction and Operations.

Notes:
Concentrations in mg/L (unless otherwise noted).
Shaded cells indicate the mean monthly concentration is greater than the predicted concentration for that month.
Values below detection limit were replaced with half the detection limit for calculations.

[a] Maximum monthly base case (95th percentile) predicted concentration predicted in base case in Construction and Operations phases at WQ27 in the water quality prediction model v.13e (Lorax 2022).

[b] Mean monthly concentration October 2022 to December 2025, Construction and Operations.

Notes:
Concentrations in mg/L (unless otherwise noted).
Shaded cells indicate the mean monthly concentration is greater than the predicted concentration for that month.
Values below detection limit were replaced with half the detection limit for calculations.

[a] Maximum monthly base case (95th percentile) predicted concentration predicted in base case in Construction and Operations phases at WQ26 in the water quality prediction model v.13e (Lorax 2022).
[b] Mean monthly concentration October 2022 to December 2025, Construction and Operations.

Notes:
Concentrations in mg/L (unless otherwise noted).
Shaded cells indicate the mean monthly concentration is greater than the predicted concentration for that month.
Values below detection limit were replaced with half the detection limit for calculations.

[a] Maximum monthly base case (95th percentile) predicted concentration predicted in base case in Construction and Operations phases at WQ7 in the water quality prediction model v.13e (Lorax 2022).
[b] Mean monthly concentration October 2022 to December 2025, Construction and Operations.

Notes:
Concentrations in mg/L (unless otherwise noted).
Shaded cells indicate the mean monthly concentration is greater than the predicted concentration for that month.
Values below detection limit were replaced with half the detection limit for calculations.

[a] Maximum monthly base case (95th percentile) predicted concentration predicted in base case in Construction and Operations phases at WQ26 in the water quality prediction model v.13e (Lorax 2022).
[b] Mean monthly concentration October 2022 to December 2025, Construction and Operations.

Notes:
Concentrations in mg/L (unless otherwise noted).
Shaded cells indicate the mean monthly concentration is greater than the predicted concentration for that month.
Values below detection limit were replaced with half the detection limit for calculations.

[a] Maximum monthly base case (95th percentile) predicted concentration predicted in base case in Construction and Operations phases at WQ26 in the water quality prediction model v.13e (Lorax 2022).
[b] Mean monthly concentration October 2022 to December 2025, Construction and Operations.

Notes:
Concentrations in mg/L (unless otherwise noted).
Shaded cells indicate the mean monthly concentration is greater than the predicted concentration for that month.
Values below detection limit were replaced with half the detection limit for calculations.

[a] Maximum monthly base case (95th percentile) predicted concentration predicted in base case in Construction and Operations phases at WQ26 in the water quality prediction model v.13e (Lorax 2022).

[b] Mean monthly concentration October 2022 to December 2025, Construction and Operations.

Notes:
Concentrations in mg/L (unless otherwise noted).
"-" indicates samples not collected for that month.
Shaded cells indicate the mean monthly concentration is greater than the predicted concentration for that month.
Values below detection limit were replaced with half the detection limit for calculations.

[a] Maximum monthly base case (95th percentile) predicted concentration predicted in base case in Construction and Operations phases at WQ8 in the water quality prediction model v.13e (Lorax 2022).
[b] Mean monthly concentration October 2022 to December 2025, Construction and Operations.

Notes:
Concentrations in mg/L (unless otherwise noted).
Shaded cells indicate the mean monthly concentration is greater than the predicted concentration for that month.
Values below detection limit were replaced with half the detection limit for calculations.

[a] Maximum monthly base case (95th percentile) predicted concentration predicted in base case in Construction and Operations phases at WQ9 in the water quality prediction model v.13e (Lorax 2022).
[b] Mean monthly concentration October 2022 to December 2025, Construction and Operations.

Notes:
Concentrations in mg/L (unless otherwise noted).
Shaded cells indicate the mean monthly concentration is greater than the predicted concentration for that month.
Values below detection limit were replaced with half the detection limit for calculations.

[a] Maximum monthly base case (95th percentile) predicted concentration predicted in base case in Construction and Operations phases at WQ13 in the water quality prediction model v.13e (Lorax 2022).
[b] Mean monthly concentration October 2022 to December 2025, Construction and Operations.

Strontium	1.25	Aquatic life	NG	NG
Zinc	Sample specific[b]	Aquatic life	Sample specific[b]	Sample specific[b]

Notes:
CCME = Canadian Council of Ministers of the Environment; NG = no guideline

Units are mg/L unless otherwise indicated.

[a] Only the most conservative guideline is shown in the table. Sources of water quality guidelines include:
- Approved or working BC Water Quality Guidelines for the Protection of Aquatic Life, Wildlife, and Agriculture (Livestock; BC ENV 2025a, 2025b).
- CCME Water Quality Guidelines for the Protection of Aquatic Life or Agriculture (Livestock; CCME 2025a).

[b] This parameter has a water quality guideline based on toxicity modifying factors (e.g., hardness, pH). The guideline will be calculated on a sample-by-sample basis, consistent with guidance in BC ENV (2016).

[c] No guideline is available for this parameter. A benchmark of 500 mg/L, used in the effects assessment, will be used to confirm the results of the effects assessment.

[d] Based on the guideline for Hexavalent Chromium, as there is no guideline for Total Chromium.

[1]According to information provided by Bureau Veritas

[2]Statistical analysis could not be conducted on the data due to the shape of the dose response curve. Therefore, a LC50 value was not calculable. The data displays intermediary toxicity but no effect at the low or high concentration. The test was valid, as the validity criteria was met.

[3]According to information provided by Nautilus Environmental (Point Edward, ON)

[4]According to information provided by Nautilus Environmental (Guelph, ON)

[5]The test did not meet the control validity requirements; this data has been included as requested by the client and should be approached with caution.

LC = Lethal Concentration, IC = Inhibition Concentration, EC = Effect Concentration, CL = Confidence Limits, NA = Not Available

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted toxicity tests for ALS Environmental. Samples VA25C4197-001 DC-05, VA25C4197-002 661-10, VA25C4197-003 FC-01, and VA25C4197-004 661-01 were collected on September 14, 2025, and delivered to the Nautilus Environmental laboratory in Calgary, AB on September 16, 2025. The samples were transported in sixteen 10-L plastic containers and was received at temperatures of 8.8°C, 6.4°C, 10.9°C, and 10.8°C, respectively. Testing for *Ceriodaphnia dubia* was performed by Bureau Veritas and these tests were initiated on September 17, 2025. The *Pimephales promelas* and *Lemna minor* tests were initiated on September 17, 2025, at the Nautilus Point Edward, ON and the Nautilus Guelph, ON locations. All other tests were initiated on September 16, 2025, at the Calgary, AB location. The samples were stored in the dark at 4 ± 2°C prior to testing. The following toxicity tests were performed on the samples:

- 72-h *Pseudokirchneriella subcapitata* growth inhibition
- *Ceriodaphnia dubia* survival and reproduction
- 7-d *Pimephales promelas* survival and biomass
- 7-d *Lemna minor* growth inhibition

The *P. promelas* test for sample VA25C4197-004 661-01 did not meet the test validity criteria and are considered invalid. The data is included in this report as per client request. The data for these tests should be approached with caution.

This report describes the results of these toxicity tests. Copies of raw laboratory data sheets and statistical analyses for each test species are provided in Appendices A to D. The chain-of-custody form is provided in Appendix E.

2.0 METHODS

Methods for the toxicity tests performed at Nautilus Environmental Calgary, AB are summarized in Table 1. Methods for the toxicity tests performed at Nautilus Environmental Guelph, ON and Point Edward, ON are provided in Appendices C and D. Methods for the toxicity tests performed at Bureau Veritas are provided in Appendix B. All testing was conducted according to procedures described by the Environment Canada protocols (2007a, 2007b, 2007c, 2011). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, version 2.1.5.5, 2.1.2.3, and 2.1.4.0).

Table 1. Summary of test conditions: *Pseudokirchneriella subcapitata* growth inhibition test.

Test species	*Pseudokirchneriella subcapitata*[1], strain UTCC# 37
Organism source	In-house axenic culture, obtained from Canadian Phycological Culture Center
Organism age	3-to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test vessel	Microplate
Test volume	220 µL
Test solution depth	11 mm
Test concentrations	10 concentrations, at least 6 enumerated, plus laboratory control
Test replicates	5 per treatment, at least 3 enumerated; 8 for control
Number of organisms	10,000 +/- 1000 cells/mL
Control/dilution water	85% deionized water; 15% City of Calgary dechlorinated tap water supplemented with nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Feeding	None
Light intensity	3600 to 4400 lux
Photoperiod	24 hours light
Aeration	None
Test measurements	pH of 91% and control at test initiation and test completion; light levels and temperature measured daily
Test protocol	Environment Canada (2007), EPS 1/RM/25
Statistical software	CETIS version 2.1.5.5
Test endpoints	Algal cell growth inhibition
Test acceptability criteria for controls	>16-fold increase in number of algal cells; CV ≤ 20%; no trend when analyzed using Mann-Kendall test
Reference toxicant	Zinc (added as $ZnSO_4$)

[1]*Pseudokirchneriella subcapitata* (Korschikov) Hindák (OECD, 2011) has recently been renamed *Raphidocelis subcapitata* (Guiry and Guiry, 2018) and was formerly known as *Selenastrum capricornutum*. *P. subcapitata* is used throughout this document because it is being used in the EPS 1/RM/25 (Environment Canada, 2007) and OECD 201 (2011) test methods. *P. subcapitata* is currently regarded as a synonym of *R. subcapitata*.

3.0 RESULTS

Results of the toxicity tests for sample VA25C4197-001 DC-05 performed at Nautilus Environmental are summarized in Tables 2 to 4. Results of the toxicity tests performed at Bureau Veritas are provided in Appendix B. No inhibitory were observed for *P. subcapitata* cell yield, resulting in an IC25 value of >91% (Table 2). There were no adverse effects observed on the survival of *C. dubia*, resulting in an LC50 of >100%, however, reproduction was affected, resulting in an IC25 of 87.1% (Appendix B). No adverse effects were observed on survival or biomass of *P. promelas*, resulting in an LC25 and IC25 of >100% (Table 3). No inhibitory effects on frond growth or dry weight of *L. minor* were observed, resulting in IC25 values of 97% (Table 4).

Results of the toxicity tests for sample VA25C4197-002 661-10 performed at Nautilus Environmental are summarized in Tables 5 to 7. Results of the toxicity tests performed at Bureau Veritas are provided in Appendix B. No inhibitory effects were observed for *P. subcapitata* cell yield, resulting in an IC25 value of >91% (Table 5). There were adverse effects observed on the reproduction of *C. dubia*, resulting in an IC25 of 28.8% (Appendix B). Statistical analysis could not be conducted on the *C. dubia* survival data due to the shape of the dose response curve. Therefore, a LC50 value was not calculable. The *C. dubia* survival data displays intermediary toxicity but no effect at the low or high concentrations (Appendix B). No adverse effects were observed on survival or biomass of *P. promelas*, resulting in an LC25 and IC25 of >100% (Table 6). No inhibitory effects on frond growth or dry weight of *L. minor* were observed, resulting in IC25 values of >97% (Table 7). Significant stimulation was observed in *L. minor* frond growth in all test concentrations except for the 1.5% concentration. Significant stimulation was also observed in *L. minor* dry weight in all test concentrations except for the 1.5%, 3.0%, and 6.0% concentrations.

Results of the toxicity tests for sample VA25C4197-003 FC-01 performed at Nautilus Environmental are summarized in Tables 8 to 10. Results of the toxicity tests performed at Bureau Veritas are provided in Appendix B. No inhibitory were observed for *P. subcapitata* cell yield, resulting in an IC25 value of >91% (Table 8). There were no adverse effects observed on survival or reproduction of *C. dubia*, resulting in an LC50 and IC25 of >100% (Appendix B). No adverse effects were observed on survival or biomass of *P. promelas*, resulting in an LC25 and IC25 of >100% (Table 9). No inhibitory effects on frond growth or dry weight of *L. minor* were observed, resulting in IC25 values of >97% (Table 10). Significant stimulation was observed in *L. minor* frond growth and dry weight in test concentration 97%.

* = Indicates results that were significantly greater than the laboratory control

Results of the toxicity tests for sample VA25C4197-004 661-01 performed at Nautilus Environmental are summarized in Tables 11 to 13. Results of the toxicity tests performed at Bureau Veritas are provided in Appendix B. Inhibitory effects were observed for *P. subcapitata* cell yield, resulting in an IC25 of 48.7% (Table 11). There were no adverse effects observed on survival or reproduction of *C. dubia*, resulting in an LC50 and IC25 of >100% (Appendix B). Adverse effects were observed on survival and biomass of *P. promelas*, resulting in LC25 and IC25 values of 81.3 and 70.8%, respectively (Table 12). A hormetic effect was observed on biomass for *P. promelas* with stimulation at the lower concentrations and inhibition at the higher concentrations resulting in an IC25 value of 70.8% (Table 12). Statistical analysis for the IC25 endpoint could not be conducted using non-linear regression, because a suitable model could not be identified. Therefore, test results were calculated using linear interpolation (CETIS). In test concentrations where hormesis was observed (1.56%, 3.13%, 6.25%, 12.5%, 25%, and 50%), data were replaced with control values for the purposes of statistical analysis, as recommended by Environment Canada (2005). No inhibitory effects on frond growth or dry weight of *L. minor* were observed, resulting in IC25 values of >97% (Table 13). Significant stimulation was observed in *L. minor* frond growth in test concentrations 24.2%, 48.5%, and 97%. Significant stimulation was also observed in *L. minor* dry weight in test concentrations 48.5% and 97%.

4.0 QA/QC

For testing performed at Nautilus Environmental, the health histories of the test organisms used in the exposures were acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies, unless noted below. Uncertainty associated with these tests is best described by the standard deviations around the means. QA/QC data for testing performed at Bureau Veritas is provided in Appendix B.

The *P. promelas* test for sample VA25C4197-004 661-01 did not meet the test validity criteria and both tests are considered invalid. The data is included in this report as per client request. The data for these tests should be approached with caution.

Results of the reference toxicant tests conducted at Nautilus Environmental during the testing program are summarized in Table 14. The reference toxicant tests were performed under the same conditions as those used during testing. Results for these tests fell within the acceptable range for organism performance of two standard deviations of the mean, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate. Results of the reference toxicant tests conducted at Bureau Veritas during the testing program are summarized in Appendix B.

Table 14. Reference toxicant test results.

Test Species	Endpoint (95% CL)	Historical Mean (2 SD Range)	CV (%)	Test Date
P. subcapitata	Growth (IC25): 25.4 (18.1 - 29.4) µg Zn/L	28.7 (19.6 - 41.8)	12.5	2025-09-30
P. promelas[1]	Survival (LC50): 0.87 (0.82 – 0.93) g/L KCl	0.95 (0.83 – 1.09)	-	2025-09-19
	Biomass (IC25): 0.76 (0.66 – 0.81) g/L KCl	0.72 (0.42 – 1.23)	-	
P. promelas[2]	Survival (LC50): 0.99 (0.92 – 1.07) g/L KCl	1.15 (0.94 – 1.39)	-	2025-09-15
	Biomass (IC25): 0.92 (0.55 – 0.97) g/L KCl	1.02 (0.87 – 1.20)	-

Inoculum - Physical Counts (must read between **981** and **1198** cells per 0.5 mL)		
	1	1095
	2	1053
	3	1111

Inoculum - Cell Yield	9975

(must be 10,000 +/- 1000 cells/mL)

Nutrients used:	normal	**mine**

pH Measurements:

Concentration	Initial Value	Final Value
100%	6.5	-
control (well D6)	6.5	-
control (well D7)	-	7.0

***pH range: 6.5-8.5; must be <1.5 units difference between control initial and final**

Quality Assurance - Test Initiation	
Algae Culture Name:	FRI·AUG·20241002AG
Age of Algae (must be 3-7 days):	4 days
Test organisms appeared healthy before use (yes/no):	yes
Turnover Date:	20250911 2
Start time of inoculum prep (must be <3hrs to loading):	1500
Volume filtered through the 45 µm membrane:	200 mL
Appearance before filtration:	yellow color
Appearance after filtration:	yellow color
Light Levels (**must be 3600 - 4400 lux**)	
Day 0: 3750	Day 2: ~~4680~~ 4400
Day 1: 4310	Day 3: 4340
Temperature (**must be 22-26°C**)	
Day 0: 25	Day 2: 25
Day 1: 25	Day 3: 25
Average Temperature: 25	

Quality Assurance - Test Termination	
Control Fold Growth (must be >16):	48
CV of standard Control Wells (must be ≤20%):	4.2
Mann-Kendall p value (must be >0.05) if CV is >10%:	—

Sample Information

Initial pH:	8.3
Initial EC (µS/cm):	99
Initial DO (mg/L):	11.5
Initial Temp (°C):	21

*recommended rotation times

Inoculum - Physical Counts (must read between **981** and **1198** cells per 0.5 mL)		
	1	1095
	2	1053
	3	1111

Inoculum - Cell Yield	9975

(must be 10,000 +/- 1000 cells/mL)

Nutrients used:	normal	**mine**

pH Measurements:

Concentration	Initial Value	Final Value
100%	6.5	-
control (well D6)	6.5	-
control (well D7)	-	6.5

***pH range: 6.5-8.5; must be <1.5 units difference between control initial and final**

Quality Assurance - Test Initiation	
Algae Culture Name:	FRI.AMG.20241002AG
Age of Algae (must be 3-7 days):	4 days
Test organisms appeared healthy before use (yes/no):	yes
Turnover Date:	2025109112
Start time of inoculum prep (must be <3hrs to loading):	1500
Volume filtered through the 45 µm membrane:	200 mL
Appearance before filtration:	c/c
Appearance after filtration:	c/c
Light Levels (**must be 3600 - 4400 lux**)	
Day 0: 4370	Day 2: 4270
Day 1: 3980	Day 3: 4230
Temperature (**must be 22-26°C**)	
Day 0: 25	Day 2: 25
Day 1: 25	Day 3: 25
Average Temperature: 25	

Quality Assurance - Test Termination	
Control Fold Growth (must be >16):	56
CV of standard Control Wells (must be ≤20%):	7.4
Mann-Kendall p value (must be >0.05) if CV is >10%:	—

Sample Information

Initial pH: 7.7
Initial EC (µS/cm): 46
Initial DO (mg/L): 109
Initial Temp (°C): 21

Inoculum - Physical Counts (must read between **981** and **1198** cells per 0.5 mL)		
	1	1095
	2	1053
	3	1111

Inoculum - Cell Yield	1975

(must be 10,000 +/- 1000 cells/mL)

Nutrients used:	normal	**mine**

pH Measurements:

Concentration	Initial Value	Final Value
100%	6.5	-
control (well D6)	6.5	-
control (well D7)	-	6.5

***pH range: 6.5-8.5; must be <1.5 units difference between control initial and final**

Quality Assurance - Test Initiation	
Algae Culture Name: FRI-AUG-20241002AG	
Age of Algae (must be 3-7 days): 4 days	
Test organisms appeared healthy before use (yes/no): yes	
Turnover Date: 2025/09/12	
Start time of inoculum prep (must be <3hrs to loading): 1000	
Volume filtered through the 45 µm membrane: 200 mL	
Appearance before filtration: c/c	
Appearance after filtration: c/c	
Light Levels (**must be 3600 - 4400 lux**)	
Day 0: 4150	Day 2: 3910
Day 1: 3780	Day 3: 4000
Temperature (**must be 22-26°C**)	
Day 0: 25	Day 2: 25
Day 1: 25	Day 3: 25
Average Temperature: 25	

Quality Assurance - Test Termination	
Control Fold Growth (must be >16):	57
CV of standard Control Wells (must be ≤20%):	3.6
Mann-Kendall p value (must be >0.05) if CV is >10%:	—

APPENDIX B – *Ceriodaphnia dubia* Subcontractor Report

Ceriodaphnia dubia 7 Day Bioassay Report

Test Details

Job and Sample ID: C578743-DTA887
Client Sample ID: 2523-0123-01
Date sample collected: 2025/09/14
Test Performed By: M1L, NM9, KPG, CSH, THR, SN6, J3P, MBY,
Test Initiation Date: 2025/09/17
Test End Date: 2025/09/24
Dates when subsamples used: 2025/09/17, 2025/09/21, 2025/09/18, 2025/09/22, 2025/09/19, 2025/09/23, 2025/09/20

Chemistries prior to test:
Dissolved Oxygen(mg/L): 8.9
Temperature (°C): 25
pH(pH units): 8.5
Conductivity (µS/cm): 129

Test Results			Endpoint	95% LCL	95% UCL	Method	Data Transforms	Outliers* (concentration-replicate)
Sample Test Results (% vol/vol)	7 day Survival Result	LC50	>100	n/a	n/a	Linear Interpolation	Log-X	n/a

	7 day Reproduction Result	IC50	0.96	0.53	1.72			
Reference Toxicant Test Initiation Date:			2025/09/05					

* If outliers were removed, description in comments.

Test Validity Criteria

Mean mortality of the control adults ≤20%:	PASS
Average of ≥15 neonates/surviving adult in the control:	PASS
3 broods produced by ≥60% of control organisms by the end of the 8th day:	PASS
Valid Reference Toxicant test:	PASS

Comments

Concentration 6.25% analyzed with 9 organisms.

Data was corrected for hormesis calculations of IC25 as Linear Interpolation (ICPIN) does not take into account the effect of hormesis.

Test Organisms

Species:	*Ceriodaphnia dubia*
Source of test organisms:	Aquatic Research Organisms. Hampton, NH
Age of organisms at test initiation:	≤ 24 hours, within 12 hours
Unusual Appearance, behaviour or treatment prior to use in test :	None
Mean % mortality of brood organisms during 7-day period proceding test:	10.7
Number of neonates produced by each organism in its third or subsequent brood:	≥8 neonates
Mean number of neonates per adult during first 3 broods in 7 days preceding test:	20
Observations of ephippia:	None

All test organisms used to initiate this test were taken from a series of individual cultures, that originated from the same mass culture.
The 4th brood or subsequent broods produced during the test are not included in the final statistical analysis.

Test Facilities and Apparatus

Test vessels used:	16 x 125 mm borosilicate glass test tubes

Control/Dilution Water

Consists of:	16 L RODI from in-house system, to which the following are added:
	4 L Perrier Brand carbonated spring water
	1 mL cyanocobalamin (Vitamin B-12)
	1 mL Sodium Selenate Decahydrate

Test Method

Reference method used for testing:	Biological Test Method: Test of Reproduction and Survival Using the Cladoceran *Ceriodaphnia dubia* . Environment Canada, EPS 1/RM/21 Second Edition - February 2007
Did the following occur during sample preparations:	
Filtered:	No
Adjusted for hardness:	No
Adjusted for pH:	No
Frequency of observations:	24 ± 2 hours
Frequency of water quality measurements:	Daily
Design and description of any specialized procedure:	N/A
Program used for statistical calculations:	Comprehensive Environmental Toxicity Information System (CETIS). Tidepool Scientific Software. Version 2.1.2.3
Reference method used for statistical calculations:	Guidance Document on Statistical Methods for Environmental Toxicity Tests. Environment Canada, EPS 1/RM/46 - March 2005, Amendments: June 2007.

Test Conditions and Procedures

Number of test solutions:	80
Number of test concentrations:	7 and a negative control
Concentrations tested (%):	1.56 3.13 6.25 12.5 25 50 100
Units of tested concentrations:	% vol/vol
Number of replicates:	10
Volume of test solutions:	≥ 15 mL
Depth of test solutions:	≥ 5 cm
Individuals per test vessel:	1
Was pre-aeration performed:	Yes
Procedure:	Oil-free compressed air is dispensed through airline tubing and a disposable pipette
Rate:	≤ 100 bubbles / minute
Duration:	20 minutes
Dates where pre-aeration occurred:	2025/09/17 2025/09/21 2025/09/18 2025/09/22 2025/09/19 2025/09/23 2025/09/20
Aeration during testing:	None

Refer to comments section for any deviations.

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

Refer to comments section for any deviations regarding reference toxicity testing.

The results contained in this report refer only to the testing of the sample submitted. Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation, including the toxicity parameters reported herein. The conductivity, dissolved oxygen and pH data contained within the toxicity report are provided for information purposes and are not individually accredited parameters. This report may not be reproduced, except in its entirety, without the written approval of the laboratory.

Ceriodaphnia dubia Survival and Reproduction Observations

Note: Mortalities are indicated by an "X" in the column and row of the concentration, replicate and day of occurance. If organism was not used for testing, this will be indicated by "N/A" in mortality and neonate columns for the replicate.

Legend: R= Reproduction (neonates), M= mortality

Ceriodaphnia dubia 7 Day Bioassay Report

Test Details

Job and Sample ID: C578743-DTA888
Client Sample ID: 2526-0123-02
Date sample collected: 2025/09/14
Test Performed By: SVC, J3P, SN6, NM9, THR, KPG, M1L, MBY
Test Initiation Date: 2025/09/17
Test End Date: 2025/09/23
Dates when subsamples used: 2025/09/17, 2025/09/18, 2025/09/19, 2025/09/20, 2025/09/21, 2025/09/22

Chemistries prior to test:
Dissolved Oxygen(mg/L): 8.2
pH(pH units): 7.4
Temperature (°C): 26
Conductivity (µS/cm): 93

Test Results			Endpoint	95% LCL	95% UCL	Method	Data Transforms	Outliers* (concentration-replicate)
Sample Test Results (% vol/vol)	7 day Survival Result	LC50	See Comment Section	N/A	N/A	N/A	N/A	N/A
	7 day Reproduction Result	IC25	28.8	18.0	32.0	Linear Interpolation	Log-X	25-3
Reference Toxicant Test Results (g/L)	7 day Survival Result	LC50	1.97	1.45	2.84	GLM: Log-Gompertz	Log-X	N/A
	7 day Reproduction Result	IC50	0.57	0.30	0.71	Linear Interpolation	Log-X	0.125-4
Control Chart Data (g/L)	7 day Survival Result	LC50	1.56	1.21	2.0	Levey-Jennings	n/a	n/a
	7 day Reproduction Result	IC50	0.96	0.53	1.72			
Reference Toxicant Test Initiation Date:			2025/09/05					

* If outliers were removed, description in comments.

Test Validity Criteria

Mean mortality of the control adults ≤20%:	PASS
Average of ≥15 neonates/surviving adult in the control:	PASS
3 broods produced by ≥60% of control organisms by the end of the 8th day:	PASS
Valid Reference Toxicant test:	PASS

Comments

The 100% concentration was analyzed with 9 fish.

Statistical analysis could not be conducted on the data due to the shape of the dose response curve. Therefore, an LC50 value was not calculable. The data displays intermediary toxicity but no effect at the low or highest concentrations. The test was valid, as the validity criteria was met.

Test Organisms

Species:	*Ceriodaphnia dubia*
Source of test organisms:	Aquatic Research Organisms. Hampton, NH
Age of organisms at test initiation:	≤ 24 hours, within 12 hours
Unusual Appearance, behaviour or treatment prior to use in test :	None
Mean % mortality of brood organisms during 7-day period proceding test:	10.7
Number of neonates produced by each organism in its third or subsequent brood:	≥8 neonates
Mean number of neonates per adult during first 3 broods in 7 days preceding test:	20
Observations of ephippia:	None

All test organisms used to initiate this test were taken from a series of individual cultures, that originated from the same mass culture.
The 4th brood or subsequent broods produced during the test are not included in the final statistical analysis.

Test Facilities and Apparatus

Test vessels used:	16 x 125 mm borosilicate glass test tubes

Control/Dilution Water

Consists of:	16 L RODI from in-house system, to which the following are added:
	4 L Perrier Brand carbonated spring water
	1 mL cyanocobalamin (Vitamin B-12)
	1 mL Sodium Selenate Decahydrate

Test Method

Reference method used for testing:	Biological Test Method: Test of Reproduction and Survival Using the Cladoceran *Ceriodaphnia dubia* . Environment Canada, EPS 1/RM/21 Second Edition - February 2007
Did the following occur during sample preparations:	
Filtered:	No
Adjusted for hardness:	No
Adjusted for pH:	No
Frequency of observations:	24 ± 2 hours
Frequency of water quality measurements:	Daily
Design and description of any specialized procedure:	N/A
Program used for statistical calculations:	Comprehensive Environmental Toxicity Information System (CETIS). Tidepool Scientific Software. Version 2.1.2.3
Reference method used for statistical calculations:	Guidance Document on Statistical Methods for Environmental Toxicity Tests. Environment Canada, EPS 1/RM/46 - March 2005, Amendments: June 2007.

Test Conditions and Procedures

Number of test solutions:	80
Number of test concentrations:	7 and a negative control
Concentrations tested (%):	1.56 3.13 6.25 12.5 25 50 100
Units of tested concentrations:	% vol/vol
Number of replicates:	10
Volume of test solutions:	≥ 15 mL
Depth of test solutions:	≥ 5 cm
Individuals per test vessel:	1
Was pre-aeration performed:	Yes
Procedure:	Oil-free compressed air is dispensed through airline tubing and a disposable pipette
Rate:	≤ 100 bubbles / minute
Duration:	20 minutes
Dates where pre-aeration occurred:	2025/09/17 2052/09/23 2025/09/20 2025/09/21 2025/09/22
Aeration during testing:	None

Refer to comments section for any deviations.

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

Refer to comments section for any deviations regarding reference toxicity testing.

The results contained in this report refer only to the testing of the sample submitted. Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation, including the toxicity parameters reported herein. The conductivity, dissolved oxygen and pH data contained within the toxicity report are provided for information purposes and are not individually accredited parameters. This report may not be reproduced, except in its entirety, without the written approval of the laboratory.

Ceriodaphnia dubia Survival and Reproduction Observations

Note: Mortalities are indicated by an "X" in the column and row of the concentration, replicate and day of occurance. If organism was not used for testing, this will be indicated by "N/A" in mortality and neonate columns for the replicate.

Legend: R= Reproduction (neonates), M= mortality

Rate:	≤ 100 bubbles / minute
Duration:	20 minutes
Dates where pre-aeration occurred:	2025/09/17 2025/09/21 2025/09/18 2025/09/22 2025/09/19 2025/09/23 2025/09/20
Aeration during testing:	None

Refer to comments section for any deviations.

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

Refer to comments section for any deviations regarding reference toxicity testing.

The results contained in this report refer only to the testing of the sample submitted. Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation, including the toxicity parameters reported herein. The conductivity, dissolved oxygen and pH data contained within the toxicity report are provided for information purposes and are not individually accredited parameters. This report may not be reproduced, except in its entirety, without the written approval of the laboratory.

Ceriodaphnia dubia Survival and Reproduction Observations

Note: Mortalities are indicated by an "X" in the column and row of the concentration, replicate and day of occurance. If organism was not used for testing, this will be indicated by "N/A" in mortality and neonate columns for the replicate.

Ceriodaphnia dubia 7 Day Bioassay Report

Test Details

Job and Sample ID: C578743-DTA890
Client Sample ID: 2526-0123-04
Date sample collected: 2025/09/14
Test Performed By: MIL, M5S, SN6, NM9, THR, KPG, CSH, KMG, J3P
Test Initiation Date: 2025/09/17
Test End Date: 2025/09/24
Dates when subsamples used: 2025/09/17, 2025/09/18, 2025/09/19, 2025/09/20, 2025/09/21, 2025/09/22, 2025/09/23

Chemistries prior to test:
Dissolved Oxygen(mg/L): 7.9
Temperature (°C): 26
pH(pH units): 6.9
Conductivity (µS/cm): 38

Test Results			Endpoint	95% LCL	95% UCL	Method	Data Transforms	Outliers* (concentration-replicate)
Sample Test Results (% vol/vol)	7 day Survival Result	LC50	>100	N/A	N/A	Linear Interpolation	Log-X	N/A
	7 day Reproduction Result	IC25	>100	N/A	N/A	Linear Interpolation	Log-X	1.56-5
Reference Toxicant Test Results (g/L)	7 day Survival Result	LC50	1.97	1.45	2.84	GLM: Log-Gompertz	Log-X	N/A
	7 day Reproduction Result	IC50	0.57	0.30	0.71	Linear Interpolation	Log-X	0.125-4
Control Chart Data (g/L)	7 day Survival Result	LC50	1.56	1.21	2.0	Levey-Jennings	n/a	n/a
	7 day Reproduction Result	IC50	0.96	0.53	1.72			
Reference Toxicant Test Initiation Date:			2025/09/05					

* If outliers were removed, description in comments.

Test Validity Criteria

Mean mortality of the control adults ≤20%:	PASS
Average of ≥15 neonates/surviving adult in the control:	PASS
3 broods produced by ≥60% of control organisms by the end of the 8th day:	PASS
Valid Reference Toxicant test:	PASS

Comments

Control concentration was analyzed with 9 organisms.

Test Organisms

Species:	*Ceriodaphnia dubia*
Source of test organisms:	Aquatic Research Organisms. Hampton, NH
Age of organisms at test initiation:	≤ 24 hours, within 12 hours
Unusual Appearance, behaviour or treatment prior to use in test :	None
Mean % mortality of brood organisms during 7-day period proceding test:	10.7
Number of neonates produced by each organism in its third or subsequent brood:	≥8 neonates
Mean number of neonates per adult during first 3 broods in 7 days preceding test:	20
Observations of ephippia:	None

All test organisms used to initiate this test were taken from a series of individual cultures, that originated from the same mass culture.
The 4th brood or subsequent broods produced during the test are not included in the final statistical analysis.

Test Facilities and Apparatus

Test vessels used:	16 x 125 mm borosilicate glass test tubes

Control/Dilution Water

Consists of:	16 L RODI from in-house system, to which the following are added:
	4 L Perrier Brand carbonated spring water
	1 mL cyanocobalamin (Vitamin B-12)
	1 mL Sodium Selenate Decahydrate

Test Method

Reference method used for testing:	Biological Test Method: Test of Reproduction and Survival Using the Cladoceran *Ceriodaphnia dubia* . Environment Canada, EPS 1/RM/21 Second Edition - February 2007
Did the following occur during sample preparations:	
Filtered:	No
Adjusted for hardness:	No
Adjusted for pH:	No
Frequency of observations:	24 ± 2 hours
Frequency of water quality measurements:	Daily
Design and description of any specialized procedure:	N/A
Program used for statistical calculations:	Comprehensive Environmental Toxicity Information System (CETIS). Tidepool Scientific Software. Version 2.1.2.3
Reference method used for statistical calculations:	Guidance Document on Statistical Methods for Environmental Toxicity Tests. Environment Canada, EPS 1/RM/46 - March 2005, Amendments: June 2007.

Test Conditions and Procedures

Number of test solutions:	80
Number of test concentrations:	7 and a negative control
Concentrations tested (%):	1.56 3.13 6.25 12.5 25 50 100
Units of tested concentrations:	% vol/vol
Number of replicates:	10
Volume of test solutions:	≥ 15 mL
Depth of test solutions:	≥ 5 cm
Individuals per test vessel:	1
Was pre-aeration performed:	Yes
Procedure:	Oil-free compressed air is dispensed through airline tubing and a disposable pipette
Rate:	≤ 100 bubbles / minute
Duration:	20 minutes
Dates where pre-aeration occurred:	2025/09/17 2025/09/21 2025/09/18 2025/09/22 2025/09/19 2025/09/23 2025/09/20
Aeration during testing:	None

Refer to comments section for any deviations.

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

Refer to comments section for any deviations regarding reference toxicity testing.

The results contained in this report refer only to the testing of the sample submitted. Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation, including the toxicity parameters reported herein. The conductivity, dissolved oxygen and pH data contained within the toxicity report are provided for information purposes and are not individually accredited parameters. This report may not be reproduced, except in its entirety, without the written approval of the laboratory.

Ceriodaphnia dubia Survival and Reproduction Observations

Note: Mortalities are indicated by an "X" in the column and row of the concentration, replicate and day of occurance. If organism was not used for testing, this will be indicated by "N/A" in mortality and neonate columns for the replicate.

APPENDIX C – *Pimephales promelas* Toxicity Test Data

NAUTILUS ENVIRONMENTAL
Suite 122, 704 Mara Street
Point Edward, ON
N7V1X4
Tel. (519) 339-8787

TOXICITY TEST REPORT

Fathead Minnow
EPS 1/RM/22

SAMPLE IDENTIFICATION

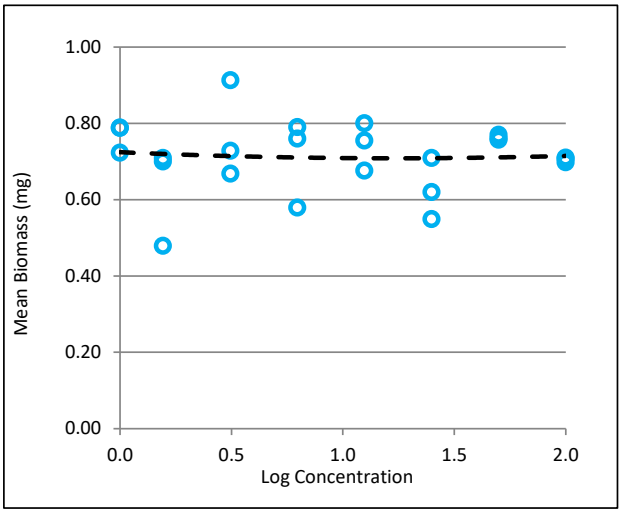
Sample Number :	PE2526-0044-01		
Company :	Nautilus Calgary	Sampling Date :	2025-09-14
Location :	Calgary, AB	Sampling Time :	14:45
Substance :	2526-0123-01	Date Received :	2025-09-17
Sampling Method :	Not provided	Time Received :	12:10
Sampled By :	Not provided	Temperature at Receipt :	18.3 °C
Sample Description :	Clear, light yellow	Date Tested :	2025-09-17

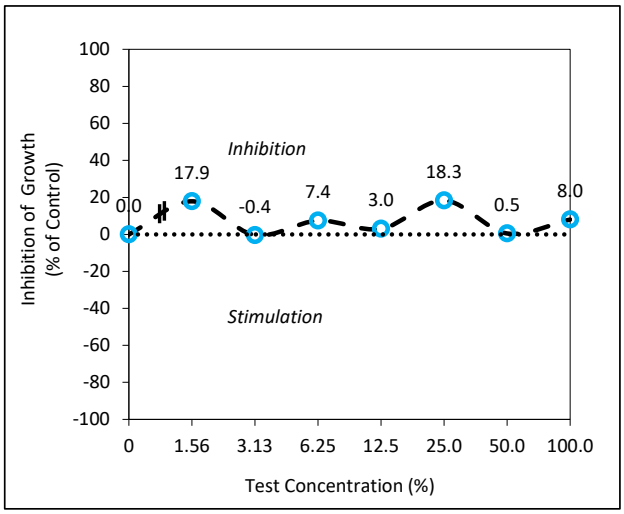
Test Method : Test of Larval Growth and Survival Using Fathead Minnows. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/22 , 2nd ed. (February 2011).

7-DAY TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Biomass)[1]	>100%	–	–
LC50	>100%	–	–

The results reported relate only to the sample tested and as received.





COMMENTS

[1]as a measure of Growth

•All test validity criteria as specified in the test method cited above were satisfied.

Approved By : Jacklyn Poole
Laboratory Manager

Sample Number : PE2526-0044-01

TEST ORGANISM

Test Organism :	*Pimephales promelas*	Culture Mortality/Diseased :	0.49 % (previous 7 days)
Organism Batch :	FH2501	Organism Age :	< 24 hours at test initiation
Source :	In-house culture		

•No organisms exhibiting unusual appearance, behaviour, or undergoing unusual treatment were used in the test.

•Inflated swim bladders were confirmed in all test organisms used in this test.

TEST CONDITIONS

Test Type :	Static Renewal	Control/Dilution Water :	Dechlorinated Municipal Water[3]
Renewal Method :	80-85% syphoned and replaced	Test Volume / Replicate :	250 mL
Renewal Frequency :	≤ 24 hours	Test Vessel :	370mL glass cup
Sample Filtration :	None	Depth of Test Solution :	6 cm
Test Aeration :	None	Organisms per Replicate :	10
pH Adjustment :	None	Number of Replicates :	3
Hardness Adjustment :	None	Test Method Deviation(s):	None

[3]no additional chemicals

REFERENCE TOXICANT DATA

Toxicant :	Potassium chloride		
Date Tested :	2025-09-19	Test Duration :	7 days
IC25 (Biomass)[1]:	0.76 g/L	LC50 :	0.87 g/L
95% Confidence Limits:	0.66 g/L; 0.81 g/L	95% Confidence Limits :	0.82 g/L; 0.93 g/L
Historical Mean IC25:	0.72 g/L	Historical Mean LC50 :	0.95 g/L
Warning Limits (± 2SD):	0.42 g/L; 1.23 g/L	Warning Limits (± 2SD) :	0.83 g/L; 1.09 g/L
Statistical Method :	3P Log Gompertz (CETIS)[a]	Statistical Method:	Untrimmed Spearman-Karber (CETIS)[a]

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

SAMPLE IDENTIFICATION

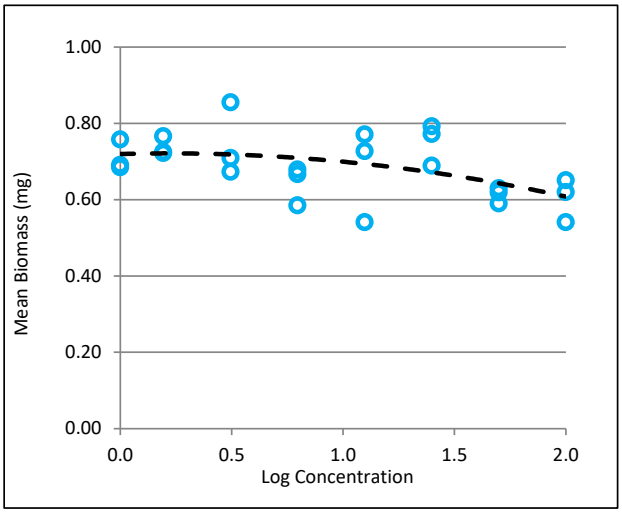
Sample Number :	PE2526-0044-02		
Company :	Nautilus Calgary	Sampling Date :	2025-09-14
Location :	Calgary, AB	Sampling Time :	13:30
Substance :	2526-0123-02	Date Received :	2025-09-17
Sampling Method :	Not provided	Time Received :	12:10
Sampled By :	Not provided	Temperature at Receipt :	18.1°C
Sample Description :	Clear, light yellow	Date Tested :	2025-09-17

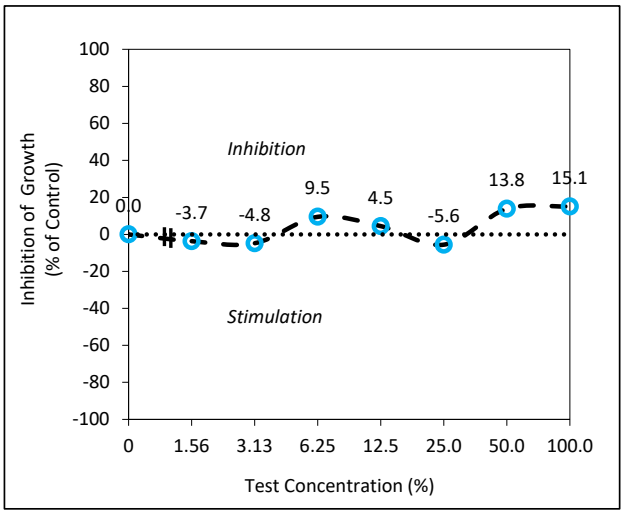
Test Method : Test of Larval Growth and Survival Using Fathead Minnows. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/22 , 2nd ed. (February 2011).

7-DAY TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Biomass)[1]	>100%	–	–
LC50	>100%	–	–

The results reported relate only to the sample tested and as received.





COMMENTS

[1]as a measure of Growth

•All test validity criteria as specified in the test method cited above were satisfied.

Approved By : Jacklyn Poole
Laboratory Manager

Sample Number : PE2526-0044-02

TEST ORGANISM

Test Organism :	*Pimephales promelas*	Culture Mortality/Diseased :	0.49 % (previous 7 days)
Organism Batch :	FH2501	Organism Age :	< 24 hours at test initiation
Source :	In-house culture		

•No organisms exhibiting unusual appearance, behaviour, or undergoing unusual treatment were used in the test.

•Inflated swim bladders were confirmed in all test organisms used in this test.

TEST CONDITIONS

Test Type :	Static Renewal	Control/Dilution Water :	Dechlorinated Municipal Water[3]
Renewal Method :	80-85% syphoned and replaced	Test Volume / Replicate :	250 mL
Renewal Frequency :	≤ 24 hours	Test Vessel :	370mL glass cup
Sample Filtration :	None	Depth of Test Solution :	6 cm
Test Aeration :	None	Organisms per Replicate :	10
pH Adjustment :	None	Number of Replicates :	3
Hardness Adjustment :	None	Test Method Deviation(s):	None

[3]no additional chemicals

REFERENCE TOXICANT DATA

Toxicant :	Potassium chloride		
Date Tested :	2025-09-19	Test Duration :	7 days

TOXICITY TEST REPORT

Fathead Minnow
EPS 1/RM/22
REVISION 1

Work Order : 258878
Sample Number : 88407

SAMPLE IDENTIFICATION

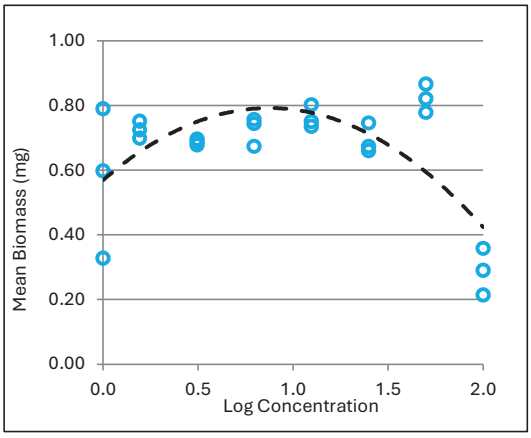
Company :	Nautilus Environmental Company Inc.	Sampling Date :	2025-09-14
Location :	Calgary AB	Sampling Time :	08:30
Substance :	2526-0123-04	Date Received :	2025-09-17
Sampling Method :	Not provided	Time Received :	12:00
Sampled By :	Not provided	Temperature at Receipt :	19 °C
Sample Description :	Clear, colourless.	Date Tested :	2025-09-17

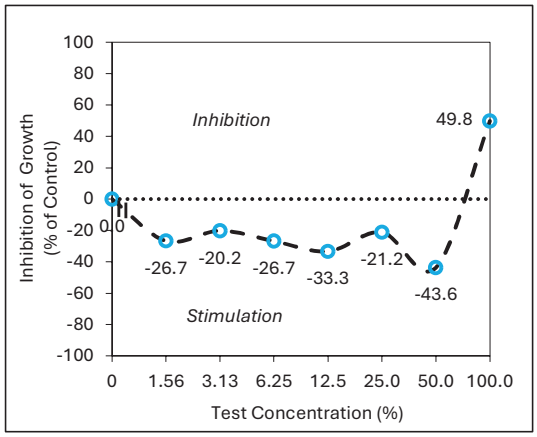
Test Method : Test of Larval Growth and Survival Using Fathead Minnows. Environment Canada, Conservation and Protection. Ottawa, Ontario. Report EPS 1/RM/22 , 2nd ed. (February 2011).

7-DAY TEST RESULTS

Effect	Value	95% Confidence Limits	Statistical Method	Trim
INVALID DUE TO CONTROL MORTALITY - THE ENDPOINTS BELOW WERE CALCULATED AT THE REQUEST OF THE CLIENT				
IC25 (Biomass)[1]	70.8%	2.95% -76.9%	Linear Interpolation (Toxstat)[d]	–
LC50	81.3%	72.6% -91.0%	Trimmed Spearman-Karber (CETIS)[a]	28.72%

The results reported relate only to the sample tested and as received.





COMMENTS

Noted Deviation(s) : The test is declared invalid because the combined and cumulative incidence of mortalities in the Control exposures was >20% on 2025-09-22 (Day 5 of the test). No corrective actions could be taken.

[1]as a measure of Growth

•The biomass data did not lend themselves to regression analysis. As required by the test method, statistical analysis to determine the IC25 (Biomass)[1] endpoint was conducted using Linear Interpolation (Toxstat)[d] . In test concentrations where hormesis was observed (i.e., 1.56%, 3.13%, 6.25%, 12.5%, 25.0%, and 50%), data were replaced with control values, as recommended in Environment Canada (2005).

Approved By : INVALID

TEST ORGANISM

Test Organism :	*Pimephales promelas*	Culture Mortality/Diseased :	0 % (previous 7 days)
Organism Batch :	Fm25-09	Organism Age :	~07:00 - 23:30 h at test start
Source :	In-house culture		

•No organisms exhibiting unusual appearance, behaviour, or undergoing unusual treatment were used in the test.
•Inflated swim bladders were confirmed in all test organisms used in this test.

TEST CONDITIONS

Test Type :	Static Renewal	Control/Dilution Water :	Well water[2]
Renewal Method :	80-85% syphoned and replaced	Test Volume / Replicate :	300 mL
Renewal Frequency :	≤ 24 hours	Test Vessel :	420 mL polystyrene beaker
Sample Filtration :	None	Depth of Test Solution :	8 cm
Test Aeration :	None	Organisms per Replicate :	10
pH Adjustment :	None	Number of Replicates :	3
Hardness Adjustment :	None	Test Method Deviation(s):	Yes (see 'COMMENTS')

[2]no additional chemicals

REFERENCE TOXICANT DATA

Toxicant :	Potassium Chloride	Analyst(s) :	JC, IS, JZJ
Date Tested :	2025-09-15	Test Duration :	7 days
IC25 (Biomass)[1] :	0.92 g/L	LC50 :	0.99 g/L
95% Confidence Limits :	0.55 - 0.97 g/L	95% Confidence Limits :	0.92 - 1.07 g/L
Statistical Method :	Linear Interpolation (Toxstat)[d]	Statistical Method :	Trimmed Spearman-Kärber (CETIS)[a]
Historical Mean IC25 :	1.02 g/L	Historical Mean LC50 :	1.15 g/L
Warning Limits (± 2SD) :	0.87 - 1.20 g/L	Warning Limits (± 2SD) :	0.94 - 1.39 g/L

[1]as a measure of Growth

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TOXICITY TEST REPORT

Lemna minor
EPS 1/RM/37

Sample Number : **PE2526-0044-01**

SAMPLE IDENTIFICATION

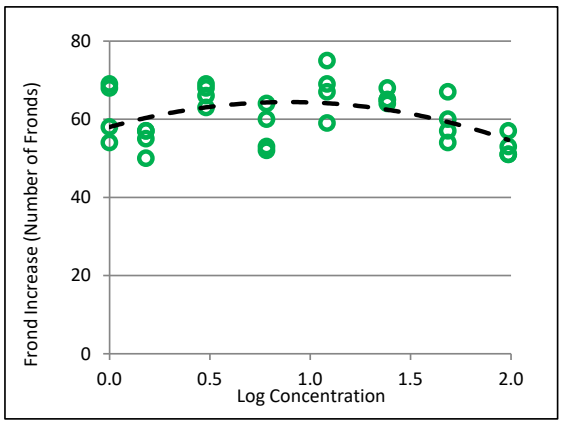
Company :	Nautilus Calgary	Sampling Date :	2025-09-14
Location :	Calgary, AB	Sampling Time :	14:45
Substance :	2526-0123-01	Date Received :	2025-09-17
Sampling Method :	Not provided	Time Received :	12:10
Sampled By :	Not provided	Temperature at Receipt (°C) :	18.3
Sample Description :	Clear, light yellow	Date Tested :	2025-09-17

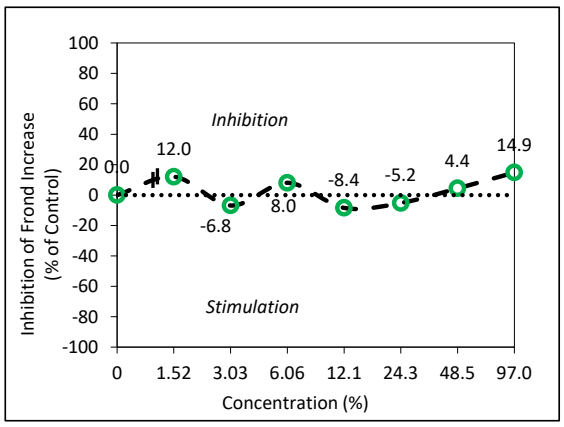
Test Method : Test for Measuring the Inhibition of Growth using the Freshwater Macrophyte, *Lemna minor* . Method Development and Application Section, Environmental Technology Centre, Environment Canada. Ottawa, Ontario. Report EPS 1/RM/37, 2nd ed. (January 2007).

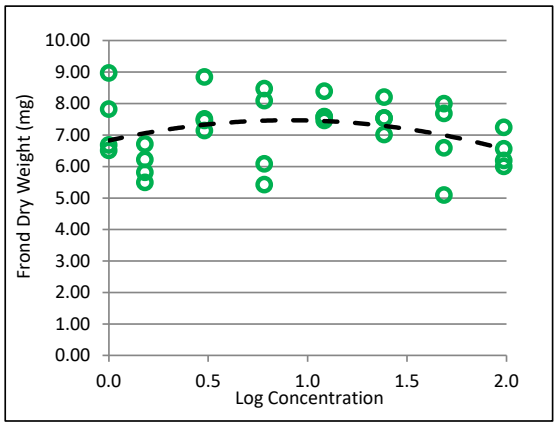
7-DAY TEST RESULTS

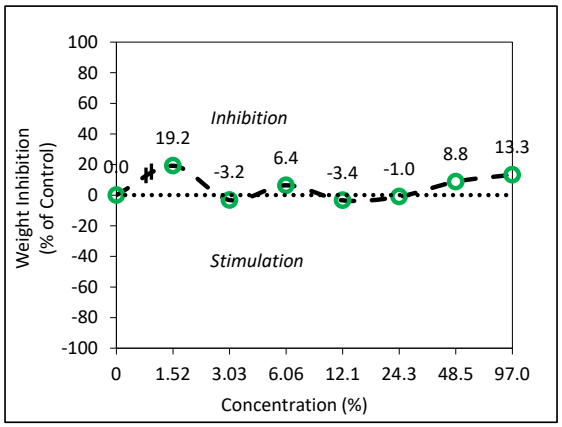
Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Frond Increase)	>97.0%	–	–
IC25 (Dry Weight)	>97.0%	–	–

The results reported relate only to the sample tested and as received.









COMMENTS

•All test validity criteria as specified in the test method cited above were satisfied.

Approved By : Jacklyn Poole
Laboratory Manager

Sample Number : PE2526-0044-01

TEST ORGANISM

Test Organism :	*Lemna minor*	Organism Acclimation :	22:00 hours (in APHA medium)
Clone :	8434	Culture Age (on Test Day 0) :	8 days
Culture Origin :	CPCC 490	Inoculum (Test Day 0) :	2 plants (3 fronds per plant)
Test Organism Source :	Axenic in-house culture	Culture Medium :	Modified Hoagland's E+
Organism Batch :	T33e	Health Criteria (in APHA) :	12.7-fold increase in 7 days

No unusual appearance or treatment of culture prior to testing. Test inoculated with healthy plants.

TEST CONDITIONS

Test Type :	Static	Sample Filtration :	1 µm Glass fiber
Renewal Frequency :	Not applicable	Sample Pre-aeration :	20 min. (≤100 bubbles/min.)
Control/Dilution Medium :	Modified APHA	Test Vessel :	370 mL glass tumbler
Source of Water :	De-ionized Municipal water	Replicates per Treatment :	4
Nutrient Spiking of Sample :	Modified APHA [2]	Test Volume :	150 mL per replicate
Initial temperature :	23 °C (100% sample)	Depth of Test Solution :	4 cm per replicate
Initial pH :	8.6 (100% sample)	Photoperiod/	Continuous
pH Adjustment :	None	Light Intensity Range :	4750 - 5580 lux
Hardness Adjustment :	None	Test Method Deviation(s) :	None

[2]stocks A, B, C (10 mL/L)

REFERENCE TOXICANT DATA

Toxicant :	Potassium chloride	IC25 (Frond Increase) :	2.33 g/L
Date Tested :	2025-09-05	95% Confidence Limits :	1.86 g/L; 2.79 g/L
Test Duration :	7 days	Statistical Method :	3P Log Logistic (CETIS)[a]
Analyst(s) :	EP	Historical Mean IC25 :	2.59 g/L
		Warning Limits (± 2SD) :	1.93 g/L; 3.45 g/L

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

TOXICITY TEST REPORT

Lemna minor
EPS 1/RM/37

Work Order : 258878
Sample Number : 88407

SAMPLE IDENTIFICATION

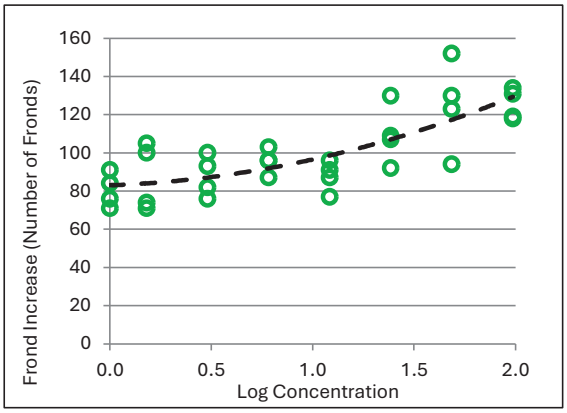
Company :	Nautilus Environmental Company Inc.	Sampling Date :	2025-09-14
Location :	Calgary AB	Sampling Time :	08:30
Substance :	2526-0123-04	Date Received :	2025-09-17
Sampling Method :	Not provided	Time Received :	12:00
Sampled By :	Not provided	Temperature at Receipt :	19 °C
Sample Description :	Clear, colourless.	Date Tested :	2025-09-17

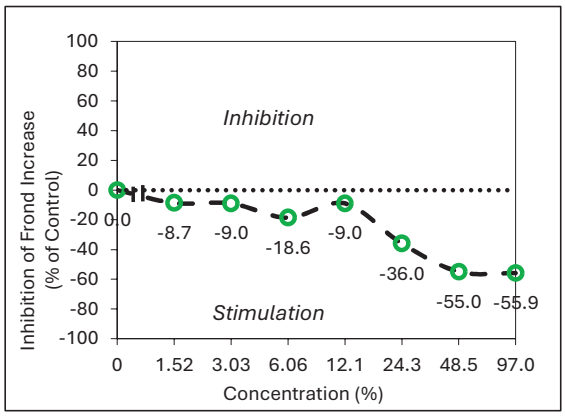
Test Method : Test for Measuring the Inhibition of Growth using the Freshwater Macrophyte, *Lemna minor* . Method Development and Application Section, Environmental Technology Centre, Environment Canada. Ottawa, Ontario. Report EPS 1/RM/37, 2nd ed. (January 2007).

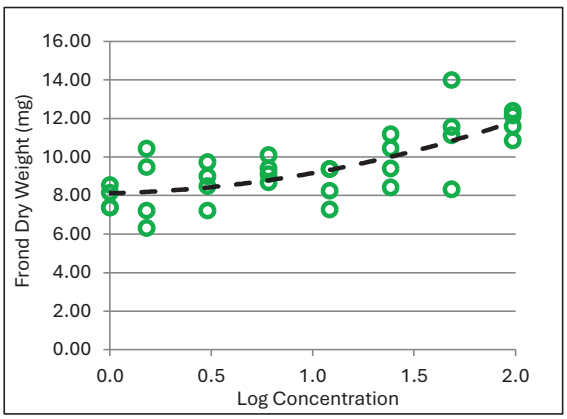
7-DAY TEST RESULTS

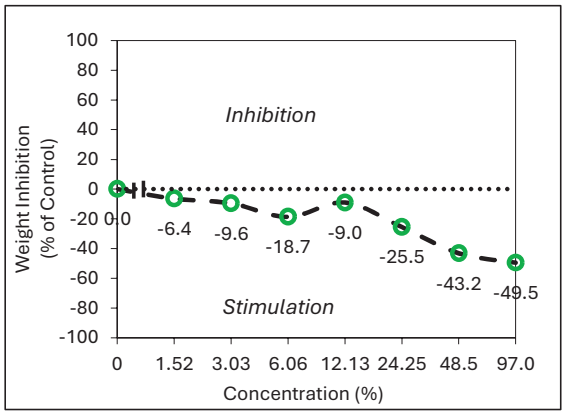
Effect	Value	95% Confidence Limits	Statistical Method
IC25 (Frond Increase)	>97.0%	–	–
IC25 (Dry Weight)	>97.0%	–	–

The results reported relate only to the sample tested and as received.









COMMENTS

•All test validity criteria as specified in the test method cited above were satisfied.

Sample Number : 88407

TEST ORGANISM

Test Organism :	*Lemna minor* L., Strain 7730	Age (on Test Day 0) :	8 days
Organism Batch :	Lm25-09	Inoculum (Test Day 0) :	2 plants (3 fronds per plant)
Culture Origin :	UTCC 492	Culture Medium :	Modified Hoaglands E+
Test Organism Source :	Axenic in-house culture	Health Criteria (in APHA) :	24.2-fold frond increase in 7 days
Organism Acclimation :	23:25 hours (in APHA medium)		

No unusual appearance or treatment of culture prior to testing. Test inoculated with healthy plants.

TEST CONDITIONS

Test Type :	Static (no sub-samples required)	Sample Pre-aeration :	20 min. at ≤100 bubbles/min.
Control/Dilution Medium :	Modified APHA	pH Adjustment :	None
Source of Water :	Well Water	Hardness Adjustment :	None
Medium Preparation Water :	Reverse Osmosis	Replicates per Concentration :	4
Medium Preparation Chemicals :	Modified APHA [2]	Test Volume per Replicate :	100 mL
Nutrient Spiking of Sample :	Modified APHA [2]	Test Vessel :	200 mL glass jar
Initial pH :	7.4 (100% sample)	Depth of Test Solution :	4.0 cm
Initial temperature :	23 °C (100% sample)	Photoperiod/Light Intensity :	Continuous, 4280 - 5420 lux
Sample Filtration :	1 µm (Whatman GF/C)	Test Method Deviation(s) :	None

[2]stocks A, B, C (10 mL/L)

REFERENCE TOXICANT DATA

Toxicant :	Potassium Chloride	IC25 (Frond Production) :	2.07 g/L
Date Tested :	2025-09-04	95% Confidence Limits :	1.71 - 2.43 g/L
Test Duration :	7 days	Statistical Method :	Non-Linear Regression (CETIS)[a]
Analyst(s) :	CB	Historical Mean IC25 :	2.00 g/L
Growth Medium :	Modified APHA	Warning Limits (± 2SD) :	1.13 - 3.56 g/L

The reference toxicity test was performed under the same experimental conditions as those used with the test sample.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted a toxicity test for ALS Environmental. Sample VA25C6029-001 661-01 was collected on September 30, 2025, and delivered to the Nautilus Environmental laboratory in Calgary, AB on October 2, 2025. The sample was transported in two 10-L plastic containers and was received at a temperature of 7.1°C. Testing for *Pimephales promelas* was initiated on October 2, 2025. The sample was stored in the dark at 4 ± 2°C prior to testing. The following toxicity test was performed on the sample:

- 7-d *Pimephales promelas* survival and biomass

This report describes the results of this toxicity test. Copies of raw laboratory data sheets and statistical analyses for the test species are provided in Appendix A. The chain-of-custody form is provided in Appendix B.

2.0 METHODS

Methods for the toxicity test are summarized in Table 1. Testing was conducted according to procedures described by the Environment Canada protocol (2011). Statistical analyses for the test were performed using CETIS (Tidepool Scientific Software, version 2.1.5.5).

Table 1. Summary of test conditions: fathead minnow *(Pimephales promelas)* survival and growth test.

Test species	*Pimephales promelas*
Organism source	In-house culture
Organism age	<24 hours post hatch
Test type	Static renewal
Test duration	7 days
Test vessel	385 mL plastic containers
Test volume	250 mL
Test solution depth	6.5 cm
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control/dilution water	De-chlorinated City of Calgary tap water amended with 4 mg/L KCl
Test solution renewal	Daily (80% renewal)
Test temperature	25 ± 1°C
Feeding	Twice each day with approximately 1500-2250 newly hatched brine shrimp *(Artemia nauplii)* per 10 fish.
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	pH, conductivity, dissolved oxygen, and temperature were measured daily; evaluated for survival daily
Test protocol	Environment Canada (2011), EPS 1/RM/22
Statistical software	CETIS version 2.1.5.5
Test endpoints	Survival and biomass
Test acceptability criteria for controls	≥80% survival, ≥0.25 mg mean dry weight
Reference toxicant	Sodium chloride (NaCl)

3.0 RESULTS

Results of the toxicity test are summarized in Table 2 for sample VA25C6029-001 661-01. There were no adverse effects observed on the survival and biomass of *P. promelas*, resulting in LC50 and IC25 values of >100% (Table 2).

Table 2. Results: fathead minnow (*Pimephales promelas)* survival and biomass test.

Concentration (% v/v)	Survival (%) (Mean ± SD)	Biomass (mg) (Mean ± SD)
Laboratory Control	93.3 ± 11.6	0.78 ± 0.07
1.56	96.7 ± 5.8	0.72 ± 0.06
3.12	96.7 ± 5.8	0.73 ± 0.11
6.25	90.0 ± 10.0	0.73 ± 0.15
12.5	100.0 ± 0.0	0.75 ± 0.08
25	96.7 ± 5.8	0.72 ± 0.07
50	96.7 ± 5.8	0.79 ± 0.02
100	80.0 ± 10.0	0.61 ± 0.12
Test endpoint (% v/v)		
LC50	>100	--
IC25	--	>100

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration

4.0 QA/QC

The health history of the test organisms used in the exposure was acceptable and met the requirements of the Environment Canada protocol. The test met all control acceptability criteria and water quality parameters remained within ranges specified in the protocol throughout the test. There were no deviations from the test methodology, unless noted below. Uncertainty associated with this test is best described by the standard deviations around the means.

There was one protocol deviation from the *P. promelas* test methodology; only two sub-samples from a single sampling event were provided by the client. Upon arrival at the laboratory, the sample was separated into three separate sub-samples for testing purposes. There were no other unusual conditions or deviations from the test method.

Results of the reference toxicant test conducted during the testing program are summarized in Table 3. The reference toxicant test was performed under the same conditions as those used during testing. Results for this test fell within the acceptable range for organism performance of two standard deviations of the mean, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the organisms used in this test was appropriate.

Table 3. Reference toxicant test results.

Test Species	Endpoint (95% CL)	Historical Mean (2 SD Range)	CV (%)	Test Date
P. promelas	Survival (LC50): 5.6 (4.6 – 6.8) g/L NaCl	7.4 (5.5 – 10.0)	9.8	2025-10-04
	Biomass (IC25): 4.9 (3.9 – 5.6) g/L NaCl	4.2 (2.7 – 6.4)	14.4	

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration, IC = Inhibition Concentration, CL = Confidence Limits

Comments:
* microbial growth

Atypical Swimming Behaviour:
Unless otherwise noted, behavior is considered to be normal
Any fish that appear moribund (lethargic), display a loss of equilibrium or show atypical swimming behaviour

Scoring Convention: # alive (# atypically swimming)
e.g. 10 (4) indicates 10 alive but 4 swimming atypically in vessel
No bracketed # indicates no atypical swimming within test vessel
Control Validity: The combined (i.e., for all replicates) incidence of mortality and or stress in the controls must be ≤ 20% for the entire duration of testing

NAUTILUS ENVIRONMENTAL

TERMS AND CONDITIONS

•Costs excludes applicable taxes. Costs do not include collection or transportation of samples to the laboratory.
•Testing must be scheduled in advance of sample collection. Required lead times will vary.
•Samples may be redirected (at the time of sample collection or on arrival) to one of Nautilus' alternate CALA accredited ecotoxicity testing locations depending on resource availability and respecting sample storage times.
•There will be a 50% surcharge for tests that are initiated on weekends and holidays upon client request
•Sample containers can be provided upon request.
•Shipping of sampling supplies to the site are not included for remote locations.
•Replacement for lost or misplaced sampling containers and supplies will be charged back at cost (+ courier/shipping charges); minimum $100 replacement fee will apply.
•Cleaning or replacement fees may apply for returned containers that are permanently marked or damaged.
•A waste disposal and sample handling fee will apply to samples that are submitted but not tested.
•In the event a routine toxicity test does not meet the "test validity criteria" (as stipulated in the appropriate method reference), Nautilus' liability is limited to repeating the analysis at no additional cost if the test can be initiated within the allowable sample hold time, or, if the test cannot be initiated within the allowable sample storage time, repeating the test on a fresh sample. Nautilus shall not be responsible for the cost of preparing, collecting, packaging or shipping the fresh sample.
•Limitation of Liability: The client releases Nautilus Environmental Company Inc. (Nautilus) from any liability and agrees to defend, indemnify and hold Nautilus harmless from any and all claims, damages, losses, and/or expenses, direct and indirect, or consequential damages, including but not limited to lawyer's fees and charges and court and arbitration costs, arising out of, or claimed to arise out of, the performance of the services, excepting liability arising from the sole negligence of Nautilus. It is further agreed that the total amount of all claims the client may have against Nautilus under these Terms and Conditions, including but not limited to claims for negligence, negligent misrepresentation and breach of contract, shall be strictly limited to the amount of service and professional fees paid to Nautilus for the services. No claim may be brought against Nautilus more than one (1) year after the cause of action arose. As the client's sole and exclusive remedy under these Terms and Conditions any claim, demand or suit shall be directed and/or asserted only against Nautilus and not against any of Nautilus's employees, officers or directors.
•Submission of samples assumes acceptance of these Terms and Conditions.
•Payment can be made by cheque or direct deposit. Email: accounting@nautilusenvironmental.ca
•Payment term: Net Due in 30 days.

APPENDIX B SEDIMENT QUALITY RESULTS

APPENDIX B-1	2025 STREAM SEDIMENT QUALITY LABORATORY RESULTS, BLACKWATER MINE
APPENDIX B-2	2025 STREAM SEDIMENT QUALITY QUALITY ASSURANCE AND QUALITY CONTROL RESULTS
APPENDIX B-3	SUMMARY OF 2025 SEDIMENT QUALITY
APPENDIX B-4	RESULTS OF THE 2025 SEDIMENT QUALITY BEFORE-AFTER-CONTROL-IMPACT ANALYSIS
APPENDIX B-5	SEDIMENT QUALITY NUMERIC PERFORMANCE METRICS
APPENDIX B-5A	2025 SEDIMENT QUALITY COMPARISON TO THE BASELINE 95TH PERCENTILES AT DC-05
APPENDIX B-5B	2025 SEDIMENT QUALITY COMPARISON TO THE BASELINE 95TH PERCENTILES AT DC-15
APPENDIX B-5C	2025 SEDIMENT QUALITY COMPARISON TO THE BASELINE 95TH PERCENTILES AT 661-05
APPENDIX B-5D	2025 SEDIMENT QUALITY COMPARISON TO THE BASELINE 95TH PERCENTILES AT 661-10
APPENDIX B-6	2025 STREAM SEDIMENT HYDROCARBON SPECIAL STUDY LABORATORY RESULTS, BLACKWATER MINE
APPENDIX B-7	2025 STREAM SEDIMENT HYDROCARBON SPECIAL STUDY QUALITY ASSURANCE AND QUALITY CONTROL RESULTS, BLACKWATER MINE

Appendix B-1 2025 Stream Sediment Quality Laboratory Results, Blackwater Mine

Notes:
'-' indicates no analysis completed.
'<' indicates value is below the presented detection limit.

Appendix B-2 2025 Stream Sediment Quality Quality Assurance and Quality Control Results

Appendix B-2: 2025 Stream Sediment Quality Quality Assurance and Quality Control Results

Sixty sediment quality samples, including five duplicates at each site, and 5 field split samples were collected for analysis of sediment quality parameters including physical parameters (i.e., moisture and pH), particle size, organic and inorganic carbon, and/or total metals. Certificates of Analysis, including complete results from laboratory quality assurance and quality control (QA/QC) checks, can be made available on request.

All analyses were executed within the required hold times (BC ENV 2023).

The laboratory identified that limited sample material was available for particle size assessment for four samples and indicated that measurement uncertainty for results may be higher than usual for: TC-01 Rep A (VA25C4819-108), TC-01 Rep B (VA25C4819-110), TC-01 Rep E (VA25C4819-116), and TC-05 Rep C (VA25C4819-122). Particle size results for these samples were interpreted with caution.

Targeted detection limits (DL) were aligned with published BC DL standards (BC MOE 2016), achieved analytical DLs were equal to or less than the target DL or the sample result was greater than five-times the raised DL for most analyses completed with a few exceptions. Achieved analytical DLs were higher than the target DL and the sample results was less than five-times the raised DL in samples TC-10 Rep B, C, D, and E for: antimony (target DL = 0.1 mg/kg), beryllium (0.1 mg/kg), bismuth (0.1 mg/kg), boron (5 mg/kg), potassium (100 mg/kg), selenium (0.1 mg/kg), silver (0.1 mg/kg), sodium (100 mg/kg), thallium (0.1 mg/kg), and tin (0.2 mg/kg); and in sample 66-01 Rep D for: antimony, bismuth, boron, potassium, selenium, sodium, and silver. The lab identified that most raised DLs were adjusted due to sample matrix effects (e.g., chemical interference, colour, turbidity).

Laboratory quality control results for completed method blanks, reference material, and laboratory control samples met the laboratory's data quality objectives with the exception if one single method blank for manganese (one of four completed). However, all sample results were greater than five-times the observed method blank concentration and are therefore considered reliable.

Laboratory duplicates met data quality objectives with the exception of one particle size and one silver measurement. One duplicate particle size measurement for passing 0.50mm marginally exceeded the data quality objective (i.e., <2-times the limit of reporting) for one sample, 661-01 Rep A (VA25C4819-002) however, the particle size duplicate results were within 5% absolute difference and are considered reliable. One duplicate silver concentration for TC-01 Rep E (VA25C4819-115) exceeded the data quality objective (relative percent difference (RPD) of 82.1% compared to 40%) due to sample heterogeneity. Silver concentrations observed at site TC-01 were reviewed and sample results from TC-01 Rep E were concluded to be reliable.

Five field split (duplicate) sediment samples were collected (Appendix B1). Duplicate analyses are completed for physical, organic and inorganic carbon, and metal parameters only. A total of 150 RPD calculations were completed. Of the total RPD calculations, 8.7% (n = 13) were greater than 20% but less than 50%, and 2.0% (n = 3) were greater than 50%. Parameters with RPD

calculations greater than 20% included: moisture, total carbon (<63 µm), total organic carbon (<63 µm), inorganic carbon (<63 µm), cadmium, and tin in one sample, chromium and mercury in two samples, and molybdenum and nickel in three samples. The RPD calculations greater than 20% were from samples collected at 705-05 (n = 10), 661-10 (n = 3), and 661-05 (n = 3). The RPD calculations greater than 50% were limited to one sample 705-05 Rep A, for nickel (RPD = 68.9%), chromium (RPD = 65.0%), and molybdenum (RPD = 63.8%). Although there was some minor heterogeneity of sediment quality results, this is typical of sediment collected from natural watercourses. The field split results suggest that sample collection was reproducible.

Overall, the field and laboratory QA/QC results demonstrated that the data quality objectives were largely met and results indicated that sediment quality data collected in 2025 were reliable and of good quality.

Appendix B-3 Summary of 2025 Sediment Quality

APPENDIX B-3: SUMMARY OF 2025 SEDIMENT QUALITY

A characterization of the 2025 sediment quality is provided. Graphical presentation for particle size and total organic carbon (TOC) is provided in Section 4.3.1 of the main report, all analyzed sediment quality parameters are included in Figures B3-1 to B3-33 below.

Particle Size and Organic Carbon

Sediments at sites in Davidson Creek, Creek 661, the regional control sites, and TC-10 were dominated by larger substrate, primarily sand (size range 0.063 to 2.0 mm) and gravel (>2 mm) and particles smaller than 63 µm was less than 20% of the sediment particle size composition (Figure 4.3-1 of the main report). Sites TC-01 and TC-05 were dominated by silt (4 to 63 µm; 39% to 66%), and this was likely due to the presence of beaver dams altering stream dynamics on Turtle Creek, including upstream of TC-01 and TC-05.

The total organic carbon in sediments in 2025 ranged from approximately 5 to 10% at sites in Creek 661 and Davidson Creek, greater than 9% in Turtle Creek (9.21% to 31.7%), and was 5% or less in regional control sites in Creek 705 and Fawnie Creek (Figure 4.2-2 of the main report).

Comparison to baseline conditions for particle size and organic carbon in the impacted stream sites of Davidson Creek (DC-05 and DC-15) and Creek 661 (661-05 and 661-10) is completed in Section 4.1.3.2 of the main report. In the Turtle Creek watershed, there has been no construction (i.e., no airstrip was constructed) to date, therefore no Mine-related influence were anticipated in 2025 at the Turtle Creek sites. Particle size composition at Turtle Creek site TC-05 in 2025 was similar to baseline and construction observations. At site TC-01 (instream control site) there was more larger sized particles, that is gravel and sand, and less silt than observed baseline and construction year whereas at TC-10 there was more silt than baseline and construction observations and less sand and more gravel than baseline years and Construction Year 1 but similar sand and gravel to 2024 observations. TOC was higher in 2025 compared to the baseline and construction period observations at TC-05 and TC-10 but was lower at TC-01. Changes in particle size and TOC composition in Turtle Creek may be related to changing stream dynamics due to known beaver activity in the area.

Total Metals

Discussion of total metals in sediments is focused on those with British Columbia (BC WLRS 2025) or federal (CCME 2025) Sediment Quality Guidelines for the Protection of Aquatic Life (SQG-Als) which include arsenic, cadmium, chromium, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium, silver, and zinc (Table 4.2-2 of the main report). Statistical comparison of “after” period concentrations for impact streams of Davidson Creek and Creek 661 for parameters with SQG-ALs is completed in Section 4.2.1 of the main report. For impact streams of Davidson Creek and Creek 661 comparison of the observed 2025 data, and baseline data on a watershed level, with SQG-ALs is completed in Section 4.2.2 of the main report.

In Davidson Creek, observed sediment concentrations of arsenic, cadmium, copper, iron, lead, manganese, mercury, molybdenum, nickel, silver, and zinc have all generally increased over time, with greater concentrations observed in 2025 compared to baseline years (Figures B3-3, B3-8, B3-12, B3-13, B3-17, B3-18, B3-19, B3-20, and B3-32). However, similar trends were also observed in the regional control sites for all metals observed increasing in Davidson Creek, though to a lesser extent for arsenic, cadmium, and zinc.

In Creek 661, sediment metal concentrations were more variable across sites and through time than observed in Davidson Creek. Copper, manganese, mercury, molybdenum, nickel, selenium, and silver concentrations in site 661-05 and 661-10 sediments were similar baseline concentrations or followed a similar trend instream or regional control sites through time (Figures B3-12, B3-17, B3-18, B3-19, B3-20, B3-23, and B3-24). Sediment arsenic concentration in 2025 at site 661-05 was similar to baseline and regional control site concentrations through time and concentrations at site 661-10 were greater than baseline and regional control sites (Figure B3-3). Cadmium concentrations at site 661-05 in 2025 were greater than baseline concentrations though cadmium concentrations were greater than baseline across all sites, including the regional control sites, in 2025 (Figure B3-8). Cadmium in sites 661-01 and 661-10 sediments have been more variable and higher than observed at site 661-05 through time and have been relatively elevated since 2023 compared to the 2017 and 2022 concentrations. Chromium concentrations in Creek 661 sediments were higher than baseline in 2025 across all sites and similar to concentrations in the regional control sites 705-05 and 705-10 (Figure B3-10). Sediment iron concentration at site 661-10 was higher in 2025 compared to baseline and site 661-05 concentrations (Figure B3-13). Iron concentrations in 2025 were similar to a baseline concentration (2021) at 661-05 and slightly higher than baseline concentrations since 2023 in 661-10 (Figure B3-13). Similar to iron, sediment lead concentrations in 2025 were similar to a baseline concentration (2021) at 661-05 but marginally greater than a baseline concentration (2022) since 2023 at site 661-10 (Figure B3-14). Sediment lead concentrations in 2017 were lower than concentrations observed since across all sites. Zinc concentrations were greater than baseline concentrations in 2025 at site 661-05 and since 2023 at site 661-10 (Figure B3-32). Zinc concentrations were also greater than previously observed at sites in Davidson Creek, the instream control site 661-01, and regional control site 705-05 in 2025. Arsenic, cadmium, iron, manganese, and molybdenum concentrations in the sediments of the instream control site 661-01 have been greater than the downstream sites throughout the monitoring period and relatively elevated since 2023 (Figures B3-3, B3-8, B3-13, B3-17, and B3-19).

In the Turtle Creek watershed, there has been no construction (i.e., no airstrip was constructed) to date, therefore no Mine-related influence were anticipated in 2025 at the Turtle Creek sites. Copper, Lead, selenium, and silver sediment concentrations in Turtle Creek at sites 661-05 and 661-10 were similar to baseline concentrations in 2025 (Figures B3-12, B3-14, B3-23, and B3-24). Cadmium, mercury, and molybdenum concentrations appear to have increased over time at sites TC-05 and TC-10 but have followed the same trend as observed in the regional control sites over time (Figures B3-8, B3-18, and B3-19). Arsenic, chromium, iron, manganese, nickel, and zinc concentrations in sediments have remained consistent with baseline concentrations at site TC-05, and have increased overtime, particularly since 2023, at site TC-10 (Figures B3-5, B3-10, B3-15, B3-19, B3-20, and B3-33). Some metals were higher in the Turtle Creek instream control site (TC-01) sediments in 2025 and throughout the monitoring years than observed in the downstream sites, including cadmium, chromium, copper, and selenium (Figures B3-8, B3-10, B3-12, and B3-23).

The following metals exceeded the SQG-AL in one or more replicates samples collected in 2025 from Turtle Creek: arsenic, cadmium, chromium, copper, iron, manganese, nickel, and selenium (Table 4.3-1 of the main report). However, for arsenic, iron, and nickel at TC-01; cadmium, iron, and nickel at TC-05; and chromium at TC-10 the mean sediment concentration (of the five replicates) did

not exceed the guideline. Turtle Creek sites and parameters at which at least one replicate sample of sediment collected exceeded the BC upper guideline were manganese at TC-05 (manganese) and arsenic, iron, and manganese at TC-10. However, the mean sediment concentration (of the five replicates) for manganese at TC-05 did not exceed the BC upper guideline.

There has been no construction in the Turtle Creek watershed to date (i.e., the airstrip has not been constructed), thus the observed exceedances reflect the naturally enriched sediments in Turtle Creek. The spatial pattern of SQG-AL exceedances in Turtle Creek has been consistent throughout the baseline, construction and operations monitoring periods (Table 4.3-2).

Observed sediment metals concentrations in 2025 that do not have SQG-ALs were typically similar to baseline monitoring years (2017, 2021, 2022, and the first year construction (2023) or followed a similar trend observed in the instream or regional control sites with few exceptions (Figures B3-1 to B3-33). Sediment aluminum, antimony, potassium, and thallium in Davidson Creek sites (DC-05 and DC-15) were greater than baseline concentrations and a similar increase was not observed in the regional control sites (Figures B3-2, B3-22, and B3-27). Observed sediment concentrations for many metals at Turtle Creek sites, including the instream control site, were relatively higher in 2025 compared to baseline concentrations and trends observed in the regional control sites (e.g., magnesium, sodium, and zirconium at site TC-01; barium, boron, molybdenum, phosphorus, and strontium at site TC-10; and calcium at sites TC-05 and TC-10).

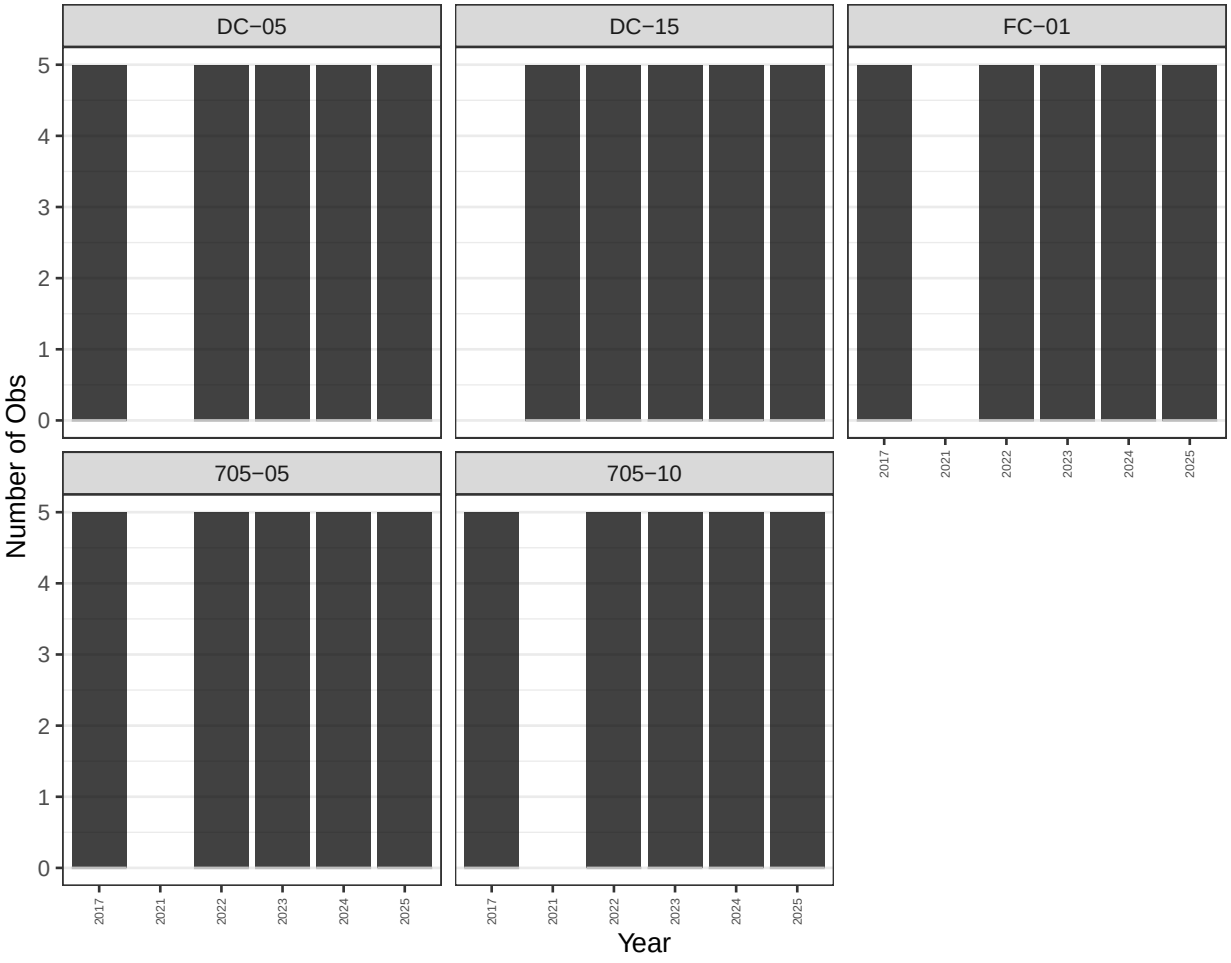
B-4.1.1 Arsenic

1 Davidson Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

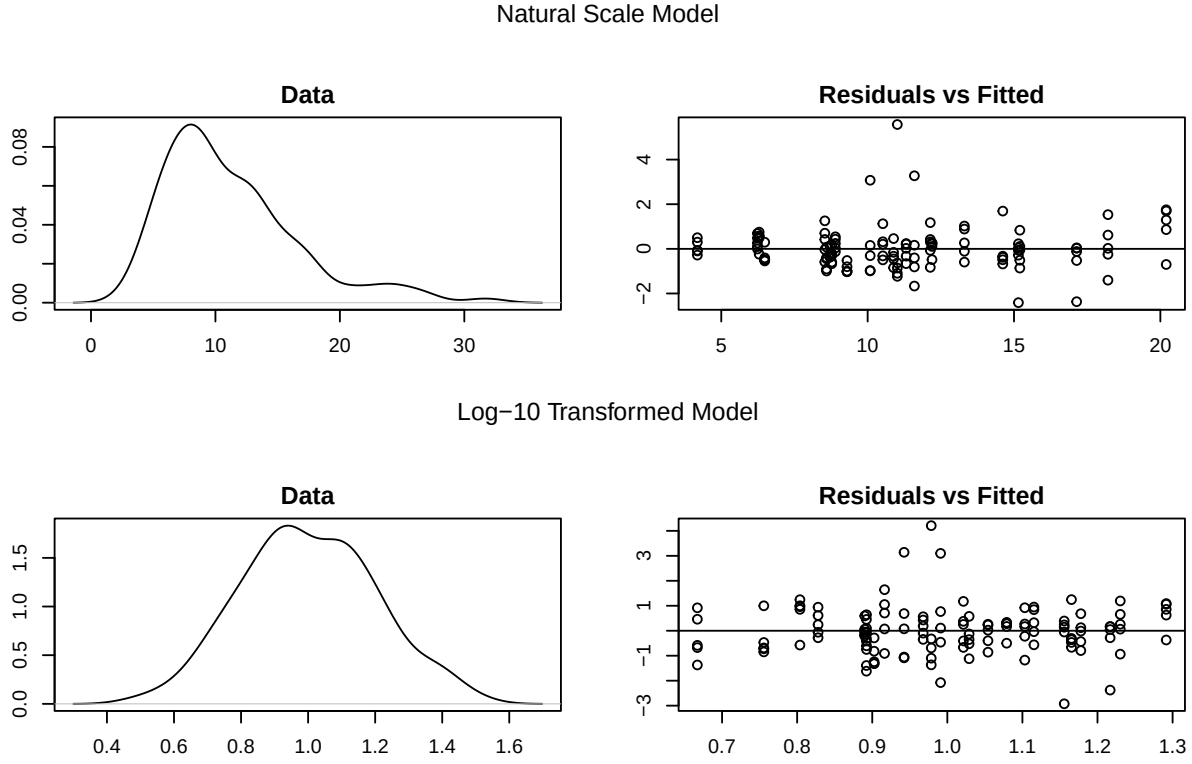
1.2 Sample Sizes for Modelling

The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Davidson Creek	DC-05	before	15	9.660	0
Davidson Creek	DC-05	after	10	17.450	0
Davidson Creek	DC-15	before	15	10.500	0
Davidson Creek	DC-15	after	10	15.650	0
Davidson Creek	FC-01	before	15	12.800	0
Davidson Creek	FC-01	after	10	13.500	0
Davidson Creek	705-05	before	15	6.940	0
Davidson Creek	705-05	after	10	10.100	0
Davidson Creek	705-10	before	15	7.440	0
Davidson Creek	705-10	after	10	6.465	0

1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	705-05	2023	9	control	before	31.70	11.01	5.572	Y
Davidson Creek	705-05	2025	9	control	after	23.75	11.60	3.274	Y
Davidson Creek	FC-01	2017	9	control	before	21.50	10.09	3.075	Y

Outliers on log scale:

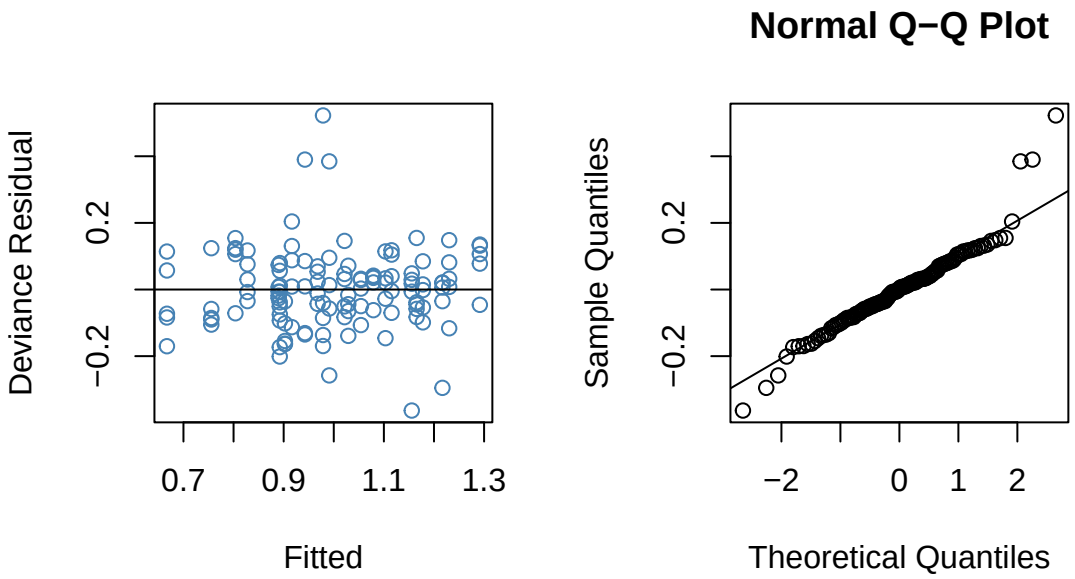
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	705-05	2023	9	control	before	1.501	0.9786	4.208	Y
Davidson Creek	FC-01	2017	9	control	before	1.332	0.9424	3.142	Y
Davidson Creek	705-05	2025	9	control	after	1.376	0.9910	3.098	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.02956	0.02956	1	3.013	1.917	0.26	
period	0.04236	0.04236	1	3.733	2.748	0.178	
class:period	0.18168	0.18168	1	116.541	11.786	<0.001	0.00358

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
125	0.2595	66%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

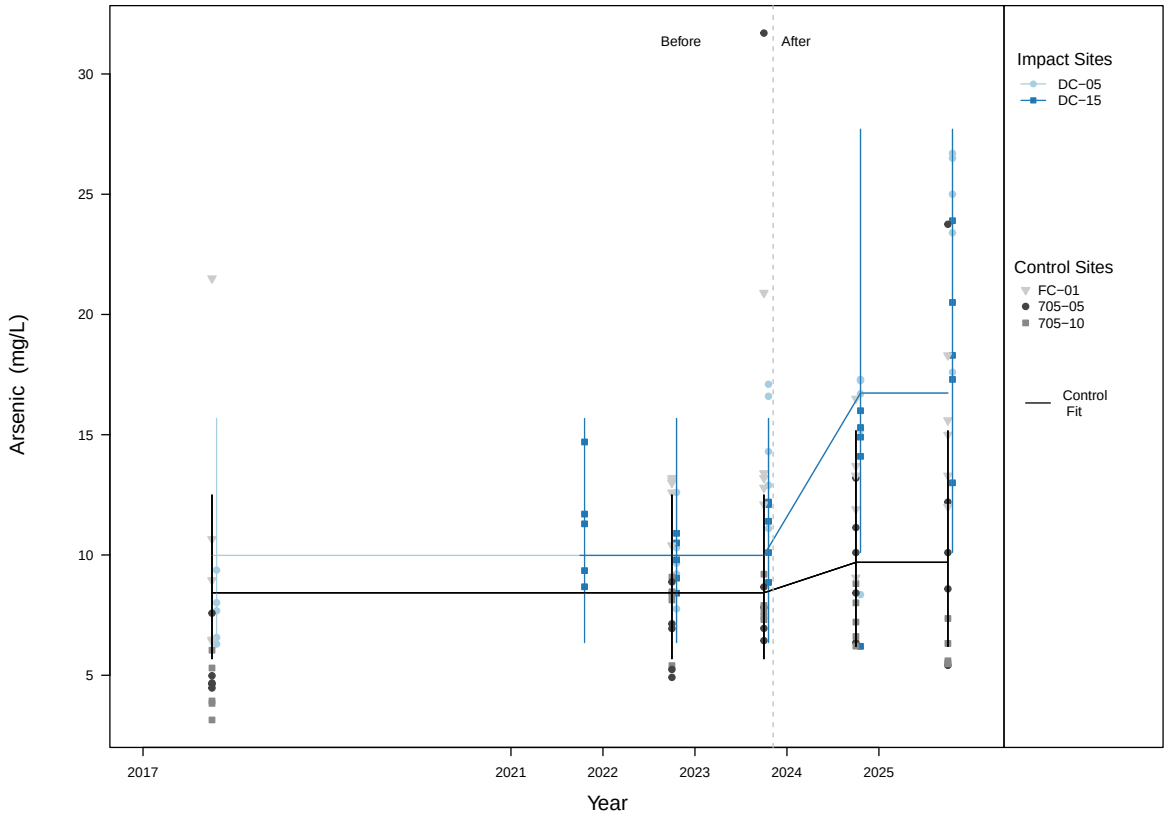
Impact vs.	Estimate	Significance
control sites	0.1637	significant

Conclusion:

The change in Arsenic concentrations at the impact sites from *before* to *after* was significantly (*adjusted p* = 0.0036) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

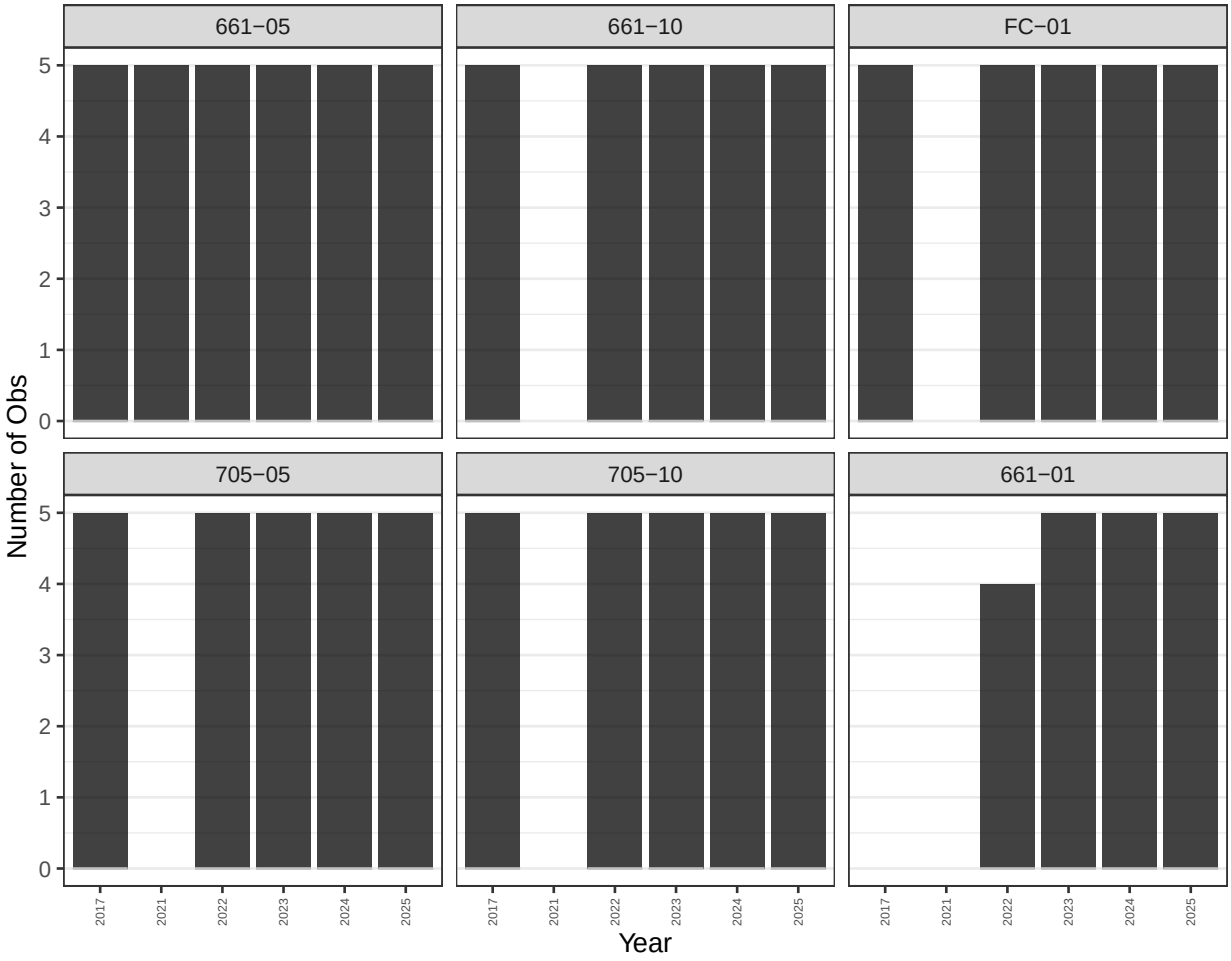
Final Summary Table

Variable	Arsenic
Watershed	Davidson Creek
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	Yes

2 Creek 661

2.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

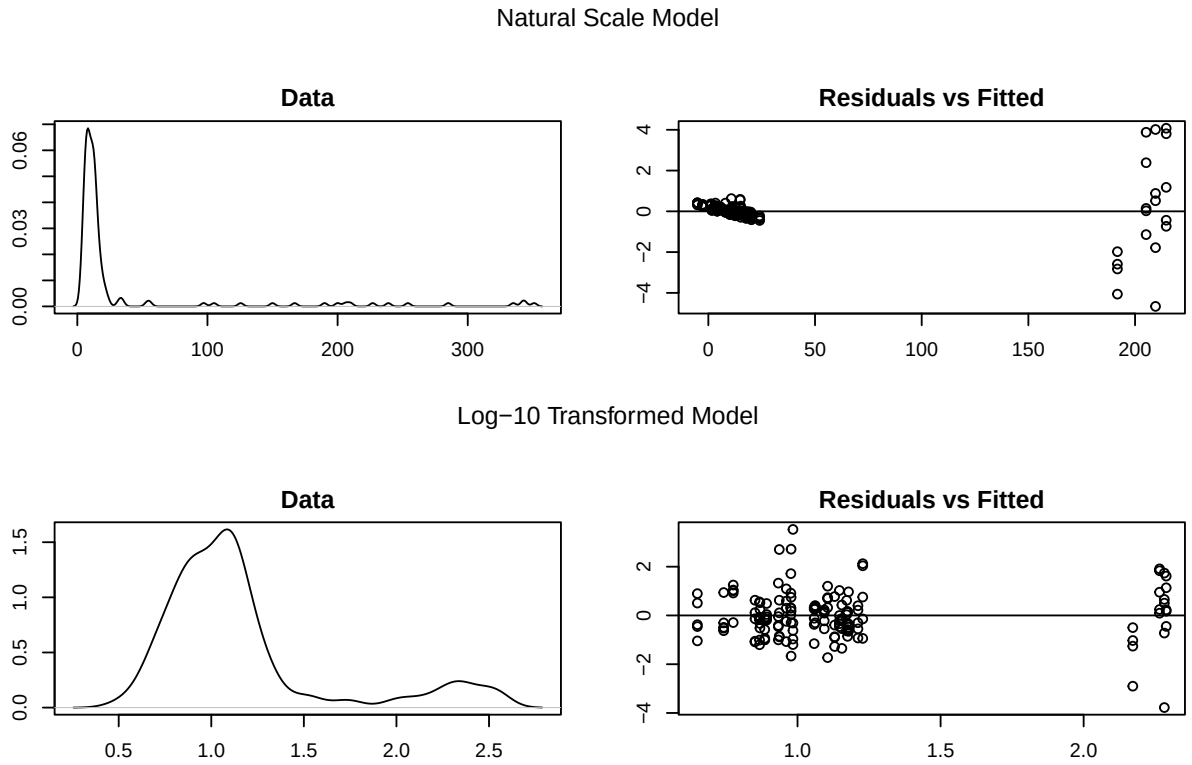
2.2 Sample Sizes for Modelling

The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Creek 661	661-05	before	20	11.000	0
Creek 661	661-05	after	10	12.250	0
Creek 661	661-10	before	15	11.200	0
Creek 661	661-10	after	10	16.800	0
Creek 661	FC-01	before	15	12.800	0
Creek 661	FC-01	after	10	13.500	0
Creek 661	705-05	before	15	6.940	0
Creek 661	705-05	after	10	10.100	0
Creek 661	705-10	before	15	7.440	0
Creek 661	705-10	after	10	6.465	0
Creek 661	661-01	before	9	167.000	0
Creek 661	661-01	after	10	233.000	0

2.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-01	2025	9	control	after	53.5	209.6	-4.664	Y
Creek 661	661-01	2024	9	control	after	351.0	214.6	4.075	Y
Creek 661	661-01	2022	9	control	before	55.8	191.7	-4.061	Y
Creek 661	661-01	2025	9	control	after	344.0	209.6	4.015	Y
Creek 661	661-01	2023	9	control	before	335.0	205.2	3.878	Y
Creek 661	661-01	2024	9	control	after	342.0	214.6	3.806	Y

Outliers on log scale:

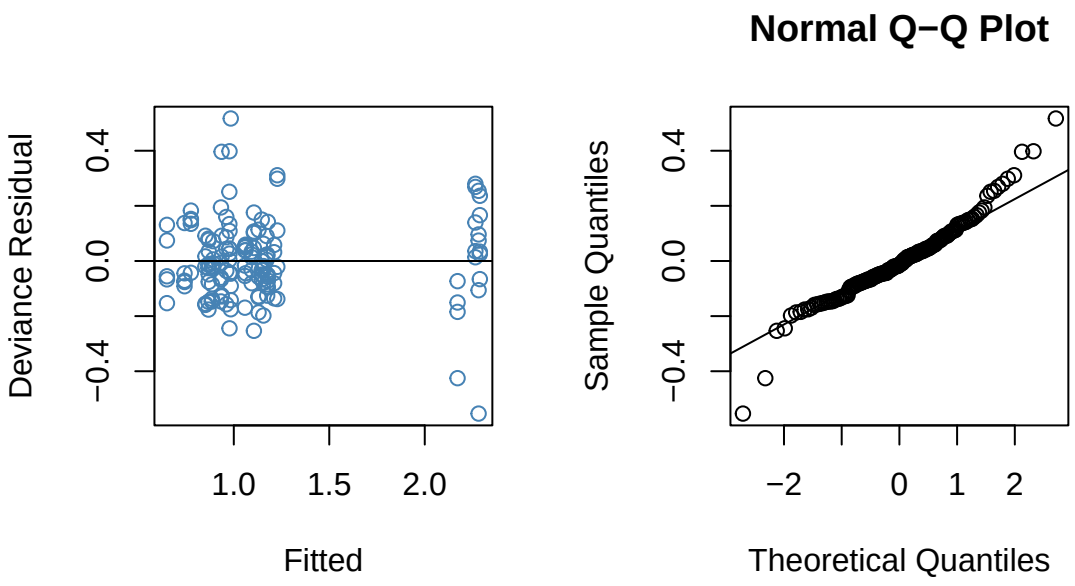
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-01	2025	9	control	after	1.728	2.282	-3.778	Y
Creek 661	705-05	2023	9	control	before	1.501	0.984	3.528	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

2.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.002674	0.002674	1	4.000	0.1245	0.742	
period	0.022748	0.022748	1	3.774	1.0590	0.365	
class:period	0.027848	0.027848	1	138.844	1.2964	0.257	0.371

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
149	0.0294	6%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-05, 661-10) and control sites (661-01, FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

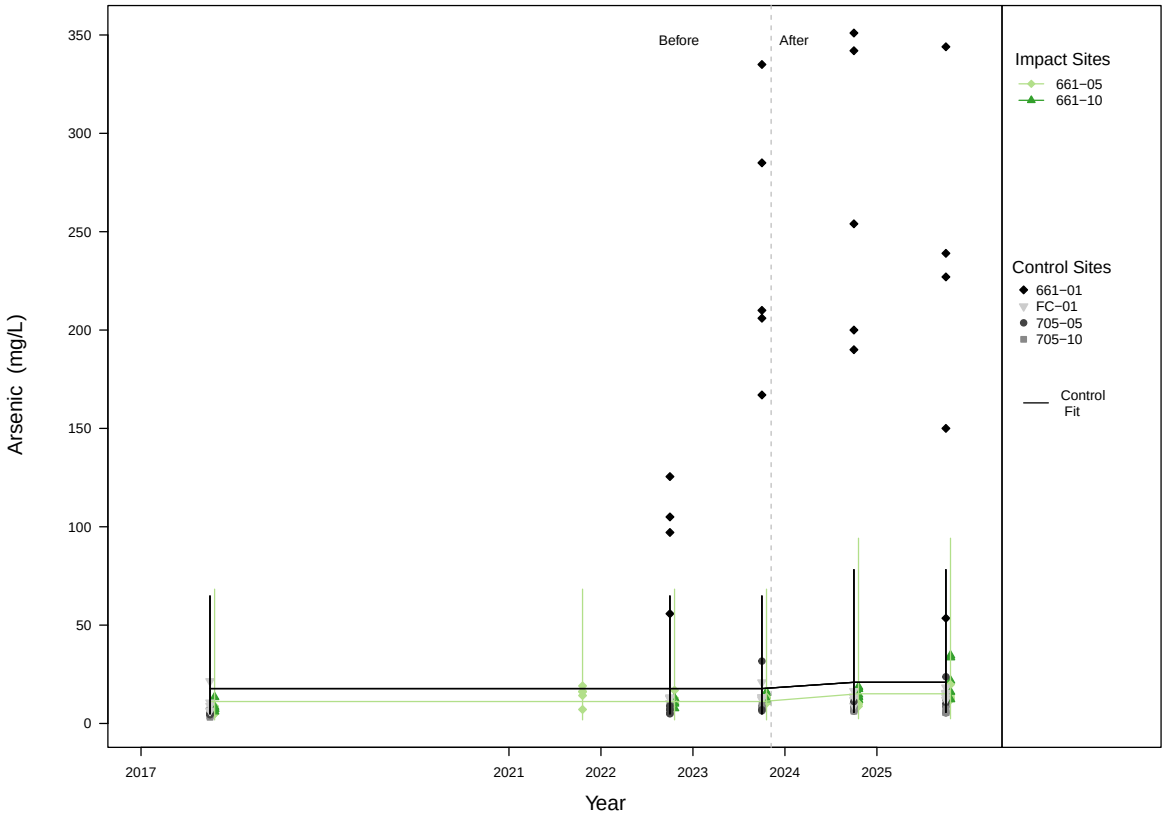
Impact vs.	Estimate	Significance
control sites	0.0595	not significant

Conclusion:

The change in Arsenic concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.371) different from the change at the control sites, according to the test on the BACI term (*class:period*).

2.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

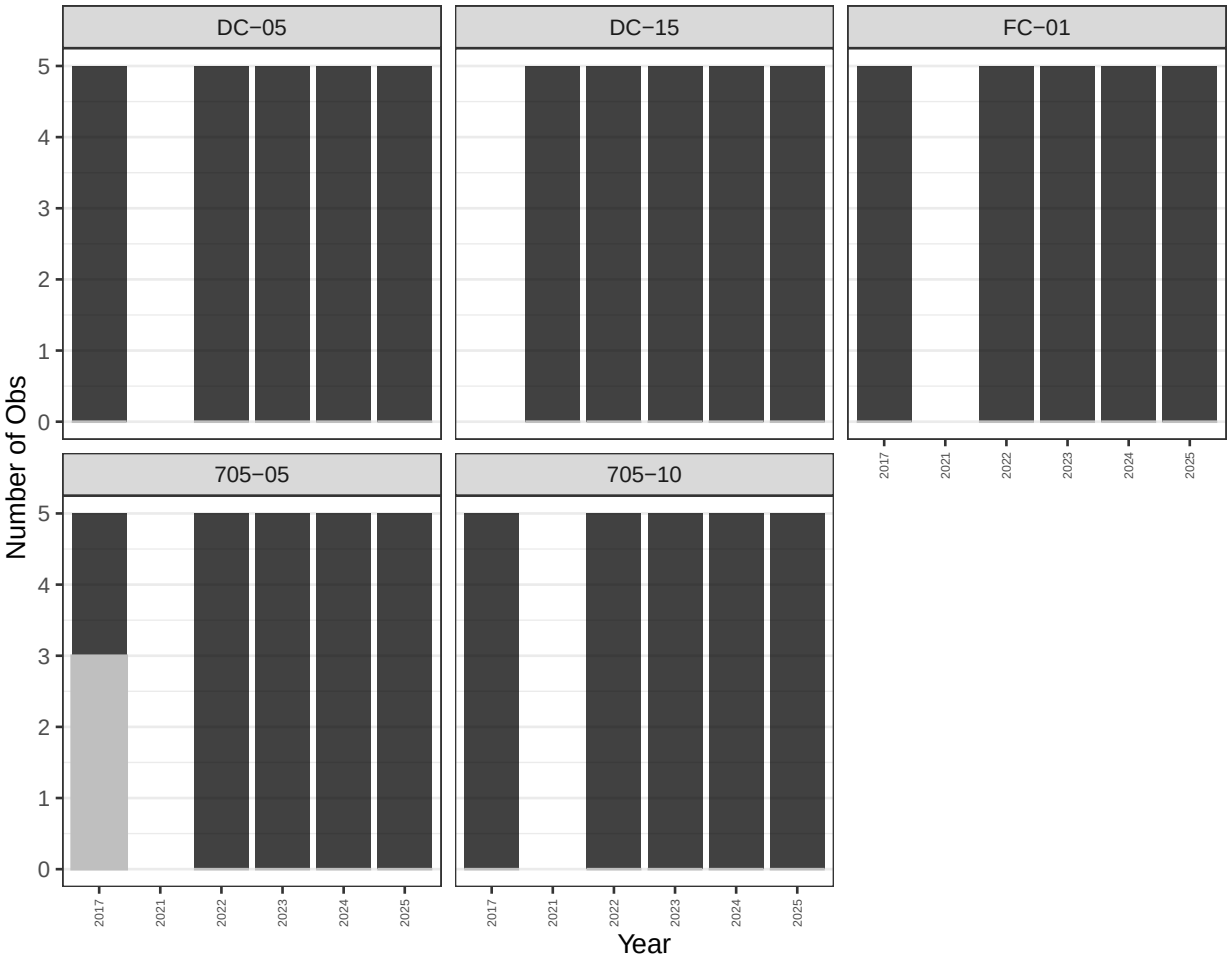
Variable	Arsenic
Watershed	Creek 661
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

B-4.1.2 Cadmium

1 Davidson Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

Watershed	Site	Year	Class	Period	#Obs Removed
Davidson Creek	705-05	2017	control	before	5

1.2 Sample Sizes for Modelling

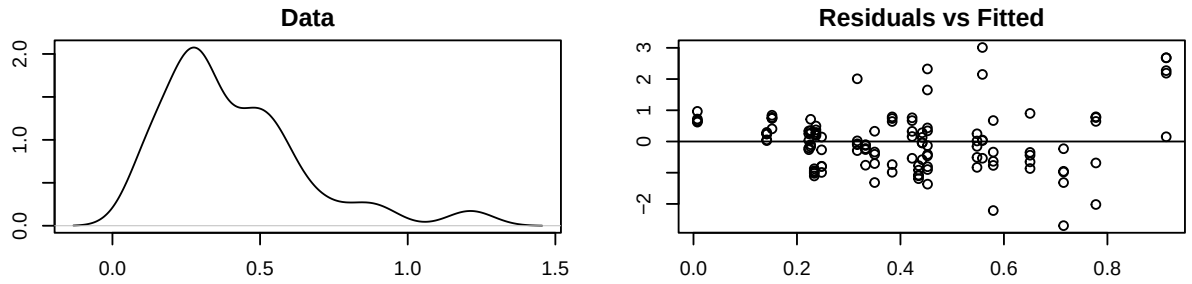
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Davidson Creek	DC-05	before	15	0.3540	0
Davidson Creek	DC-05	after	10	0.8095	0
Davidson Creek	DC-15	before	15	0.4420	0
Davidson Creek	DC-15	after	10	0.5995	0
Davidson Creek	FC-01	before	15	0.4370	0
Davidson Creek	FC-01	after	10	0.5840	0
Davidson Creek	705-05	before	10	0.1610	0
Davidson Creek	705-05	after	10	0.2500	0
Davidson Creek	705-10	before	15	0.2400	0
Davidson Creek	705-10	after	10	0.2935	0

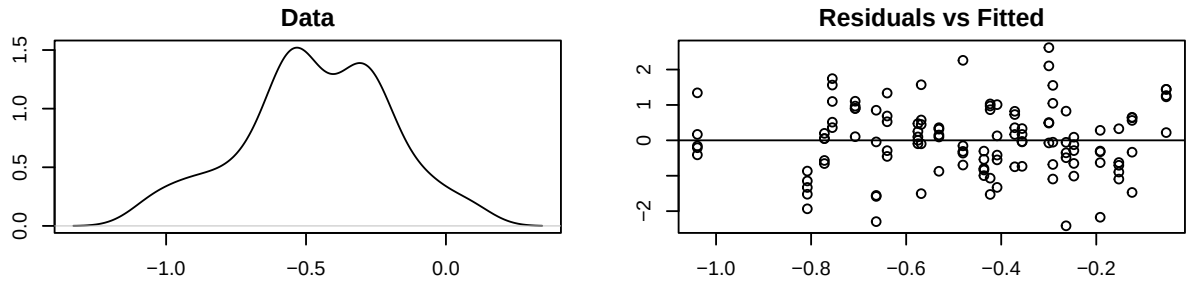
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	DC-05	2023	9	impact	before	0.925	0.5584	3.011	Y

Outliers on log scale:

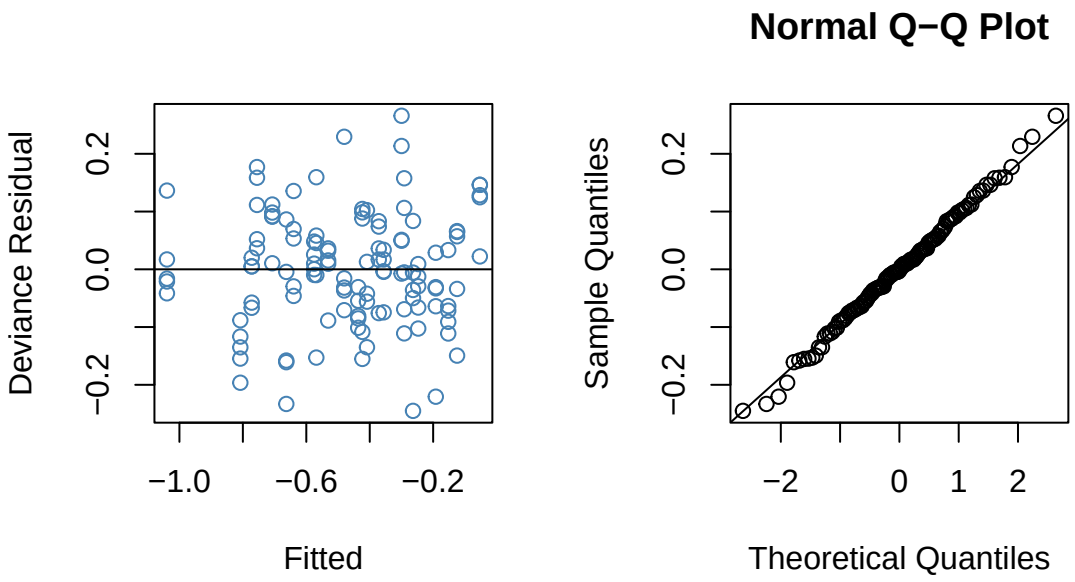
None

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.01892	0.01892	1	2.999	1.836	0.268	
period	0.02246	0.02246	1	3.947	2.179	0.215	
class:period	0.15439	0.15439	1	109.540	14.976	<0.001	0.00207

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test

120	0.3182	83%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

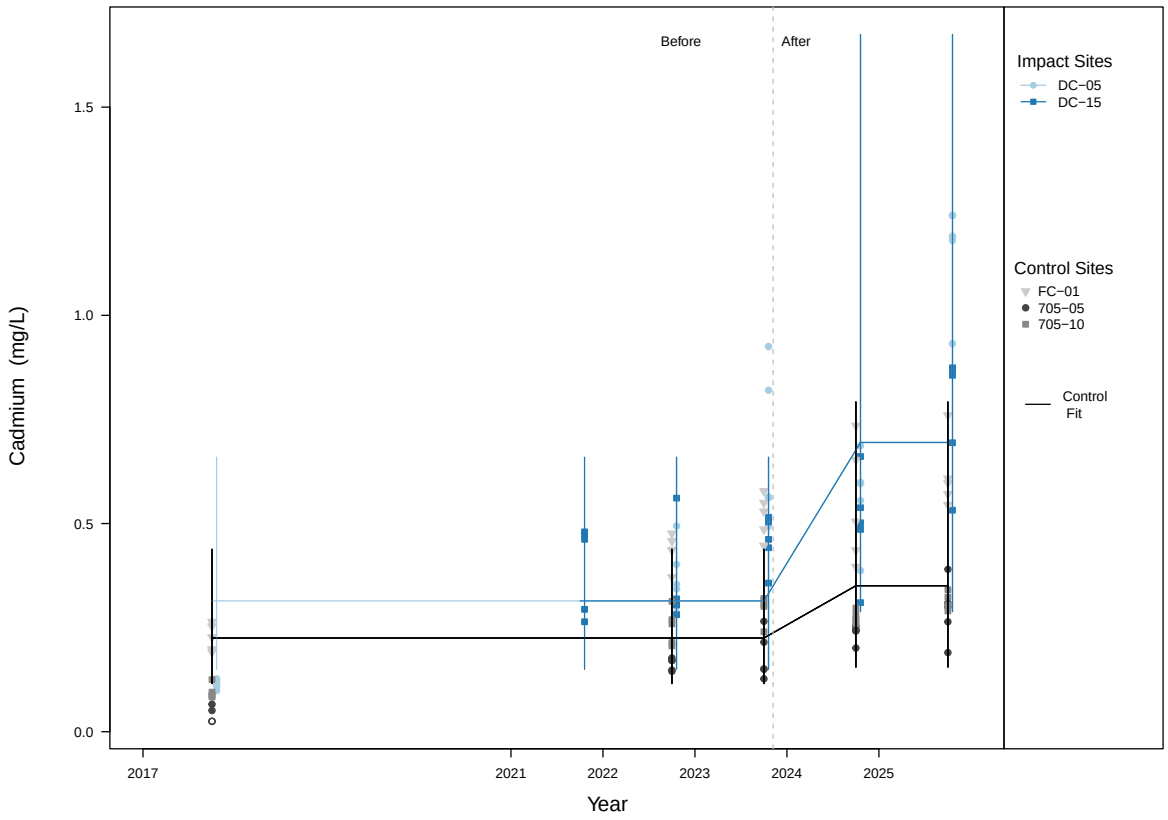
Impact vs.	Estimate	Significance
control sites	0.1522	significant

Conclusion:

The change in Cadmium concentrations at the impact sites from *before* to *after* was significantly (*adjusted p =* 0.0021) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

Variable	Cadmium
Watershed	Davidson Creek

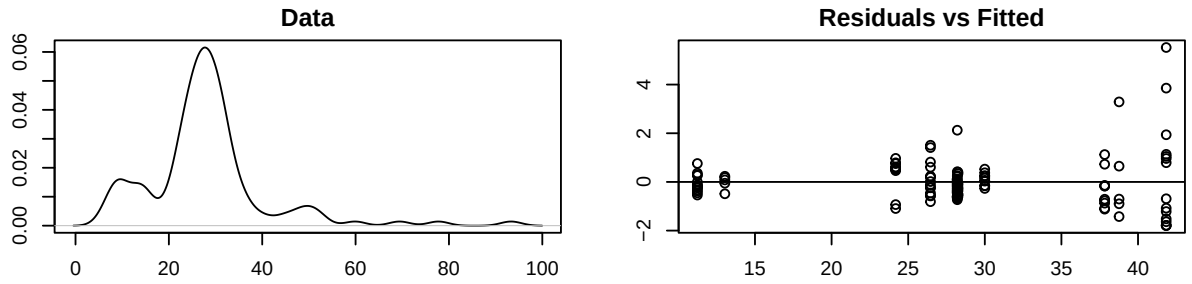
Davidson Creek	705-10	after	10	28.20	0

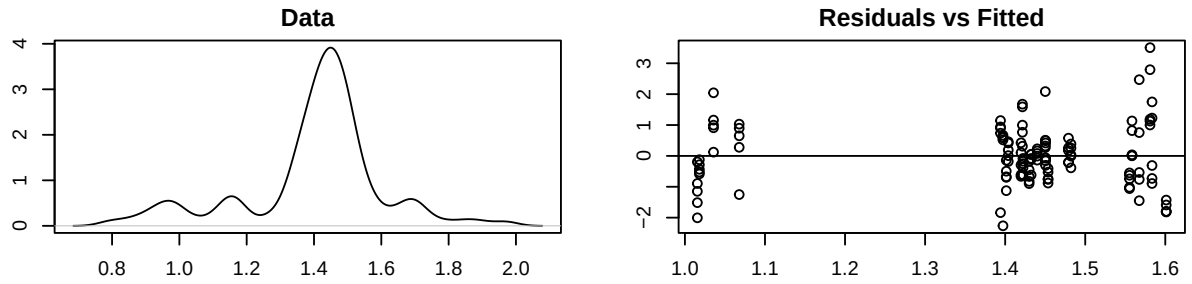
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	705-05	2025	9	control	after	93.30	41.84	5.523	Y
Davidson Creek	705-05	2025	9	control	after	77.75	41.84	3.854	Y
Davidson Creek	DC-15	2021	9	impact	before	69.40	38.76	3.288	Y

Outliers on log scale:

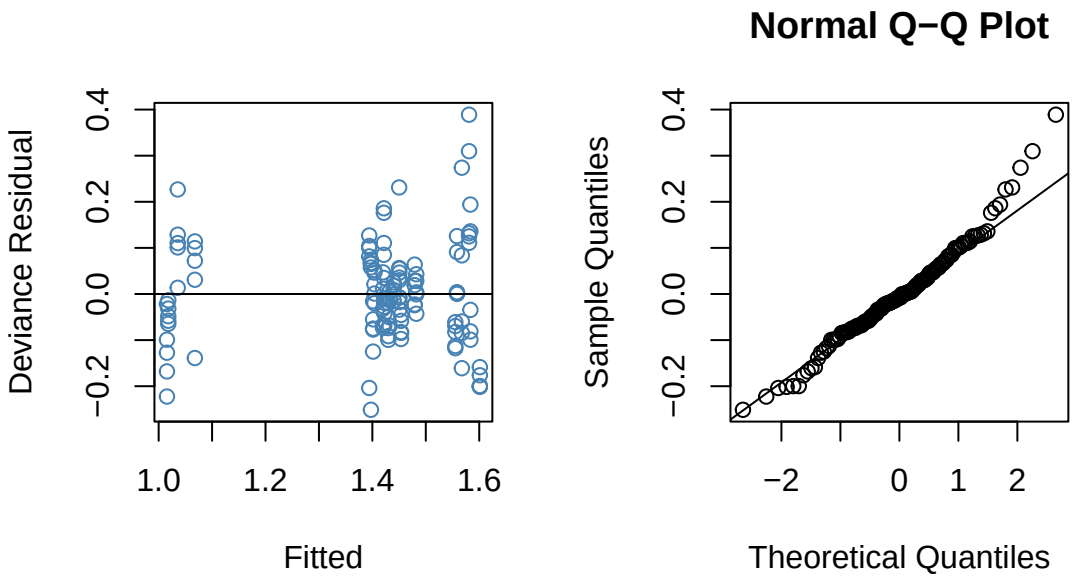
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	705-05	2025	9	control	after	1.97	1.581	3.506	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.00061	0.00061	1	3.186	0.0495	0.8370	
period	0.0057721	0.0057721	1	3.947	0.4691	0.5320	
class:period	0.0377683	0.0377683	1	115.711	3.0691	0.0824	0.168

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
125	0.0816	10%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

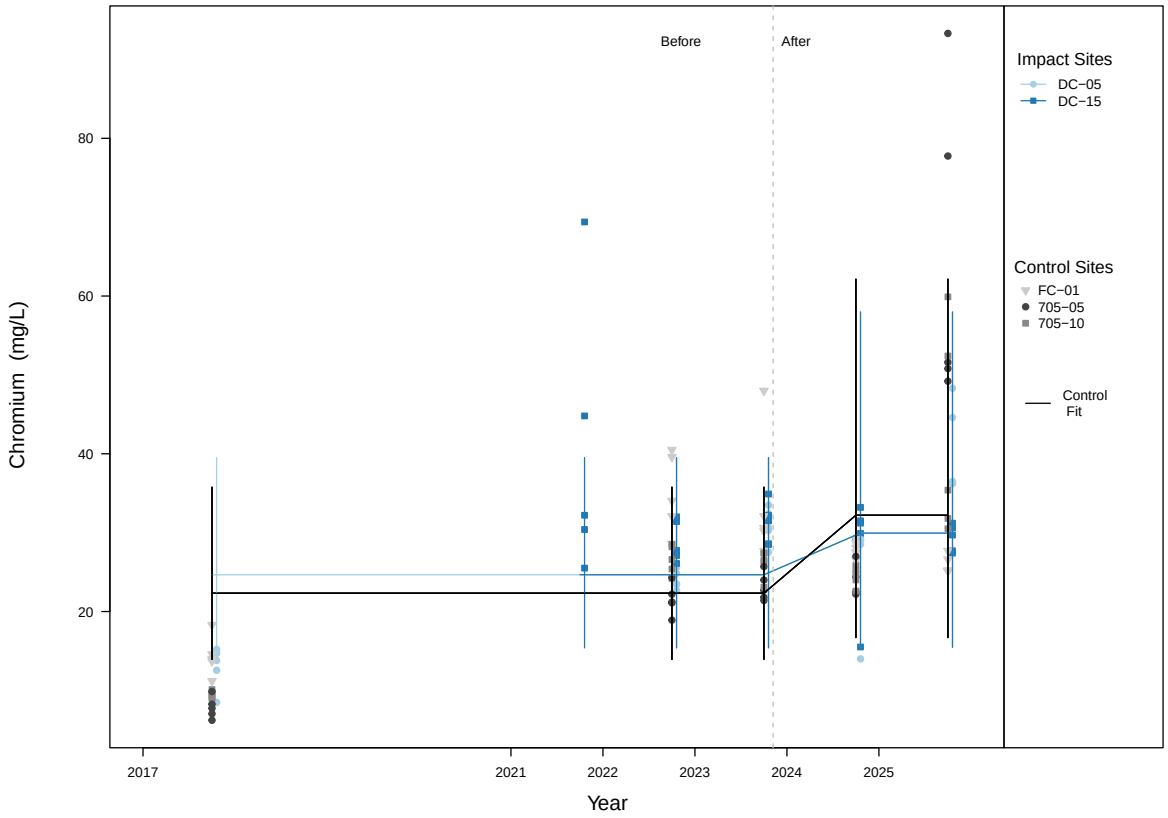
Impact vs.	Estimate	Significance
control sites	-0.0748	not significant

Conclusion:

The change in Chromium concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.168) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

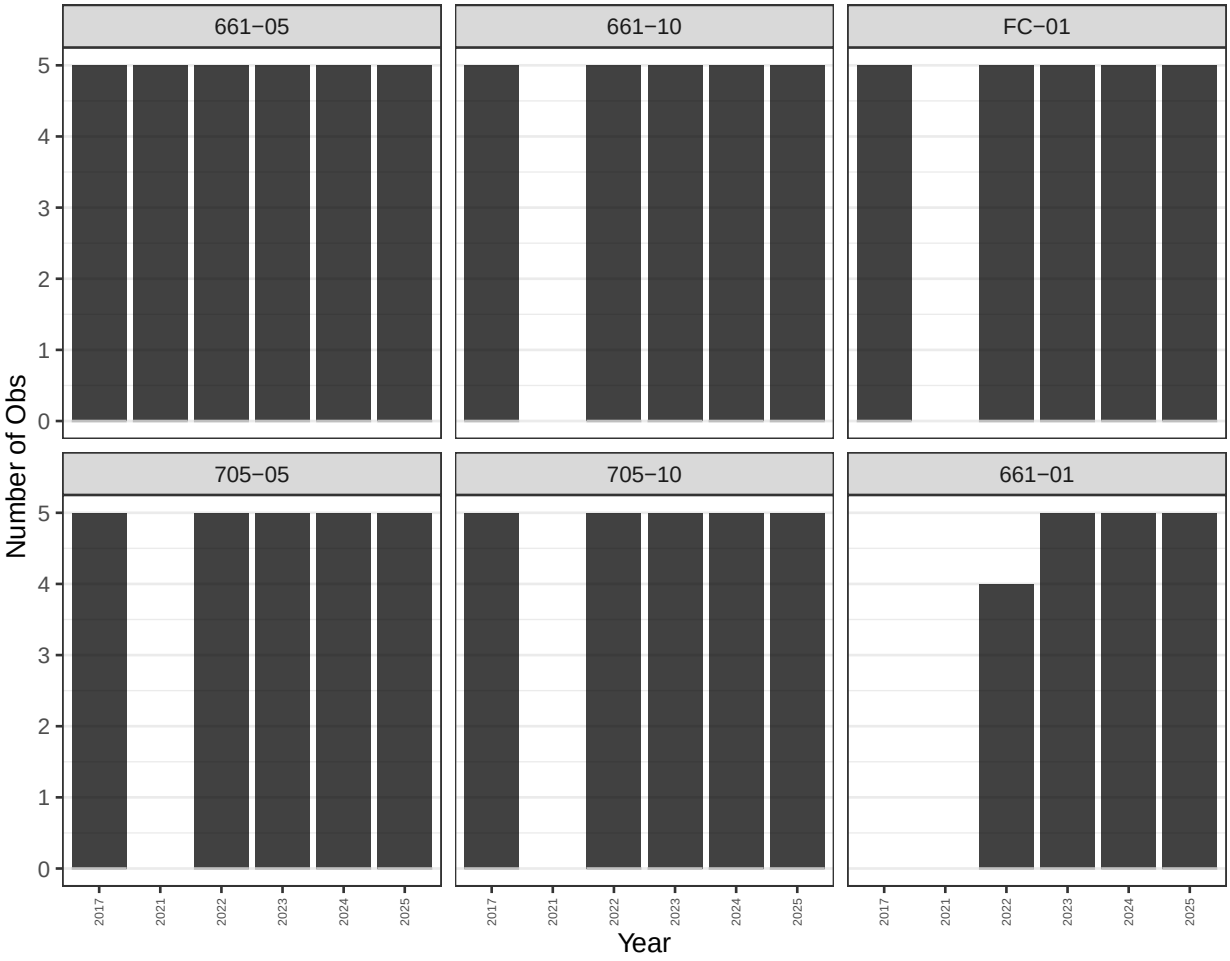
Final Summary Table

Variable	Chromium
Watershed	Davidson Creek
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

2 Creek 661

2.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

2.2 Sample Sizes for Modelling

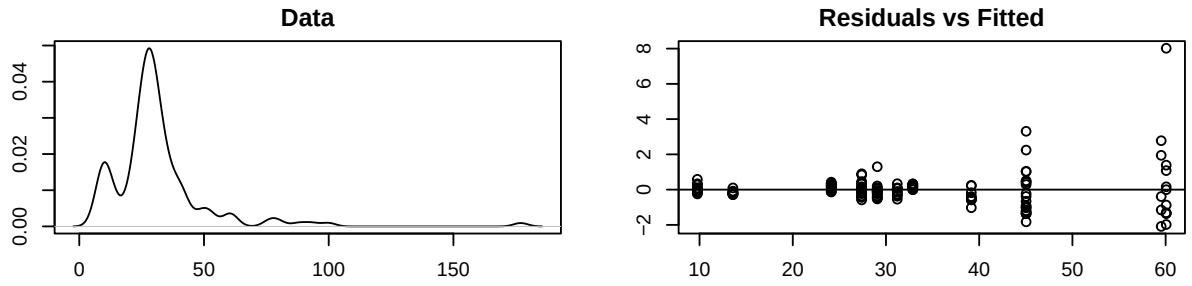
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Creek 661	661-05	before	20	32.70	0
Creek 661	661-05	after	10	41.45	0
Creek 661	661-10	before	15	27.50	0
Creek 661	661-10	after	10	38.60	0
Creek 661	FC-01	before	15	30.20	0
Creek 661	FC-01	after	10	27.05	0
Creek 661	705-05	before	15	21.20	0
Creek 661	705-05	after	10	39.25	0
Creek 661	705-10	before	15	25.40	0
Creek 661	705-10	after	10	28.20	0
Creek 661	661-01	before	9	28.20	0
Creek 661	661-01	after	10	29.55	0

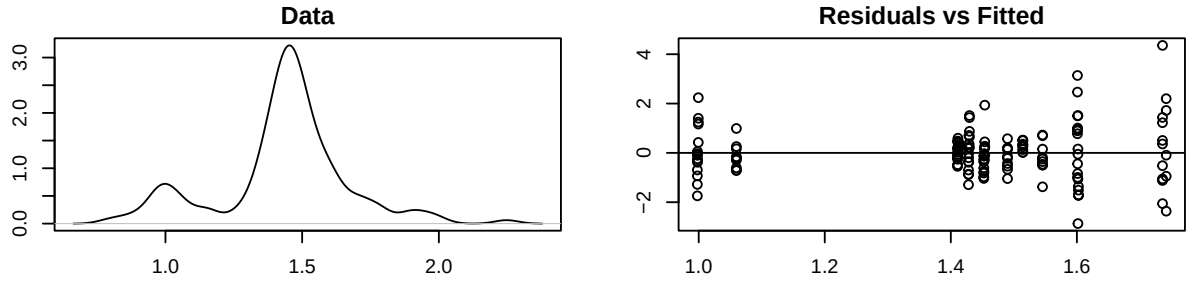
2.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-10	2025	9	impact	after	177.0	60.06	8.019	Y
Creek 661	705-05	2025	9	control	after	93.3	45.03	3.310	Y

Outliers on log scale:

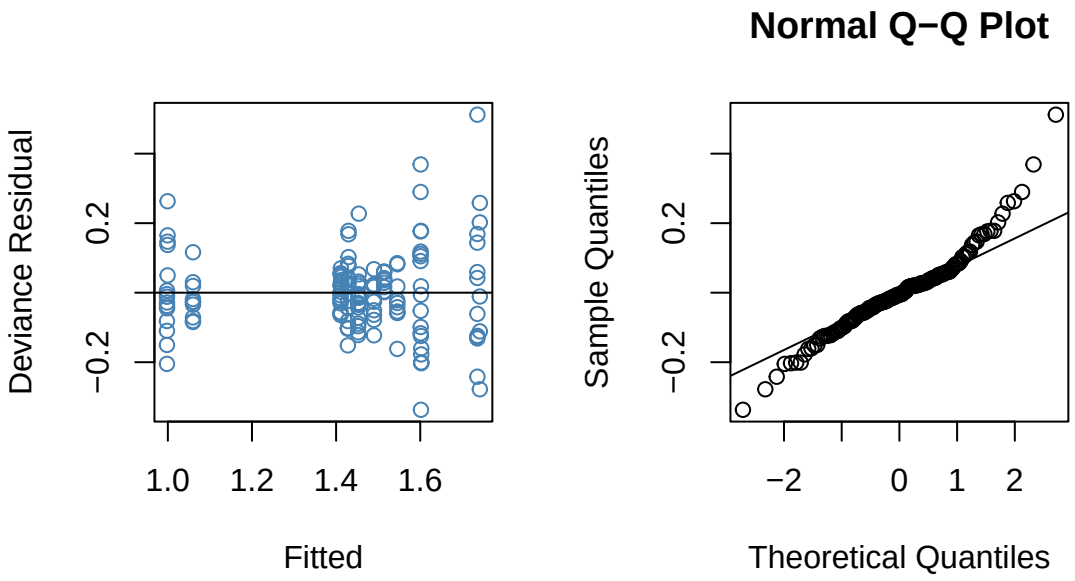
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-10	2025	9	impact	after	2.248	1.736	4.357	Y
Creek 661	705-05	2025	9	control	after	1.970	1.601	3.139	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

2.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.292984	0.292984	1	4.009	21.2074	0.0099	
period	0.006418	0.006418	1	3.969	0.4646	0.5330	
class:period	0.041829	0.041829	1	138.334	3.0278	0.0841	0.168

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
149	0.0837	12%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-05, 661-10) and control sites (661-01, FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

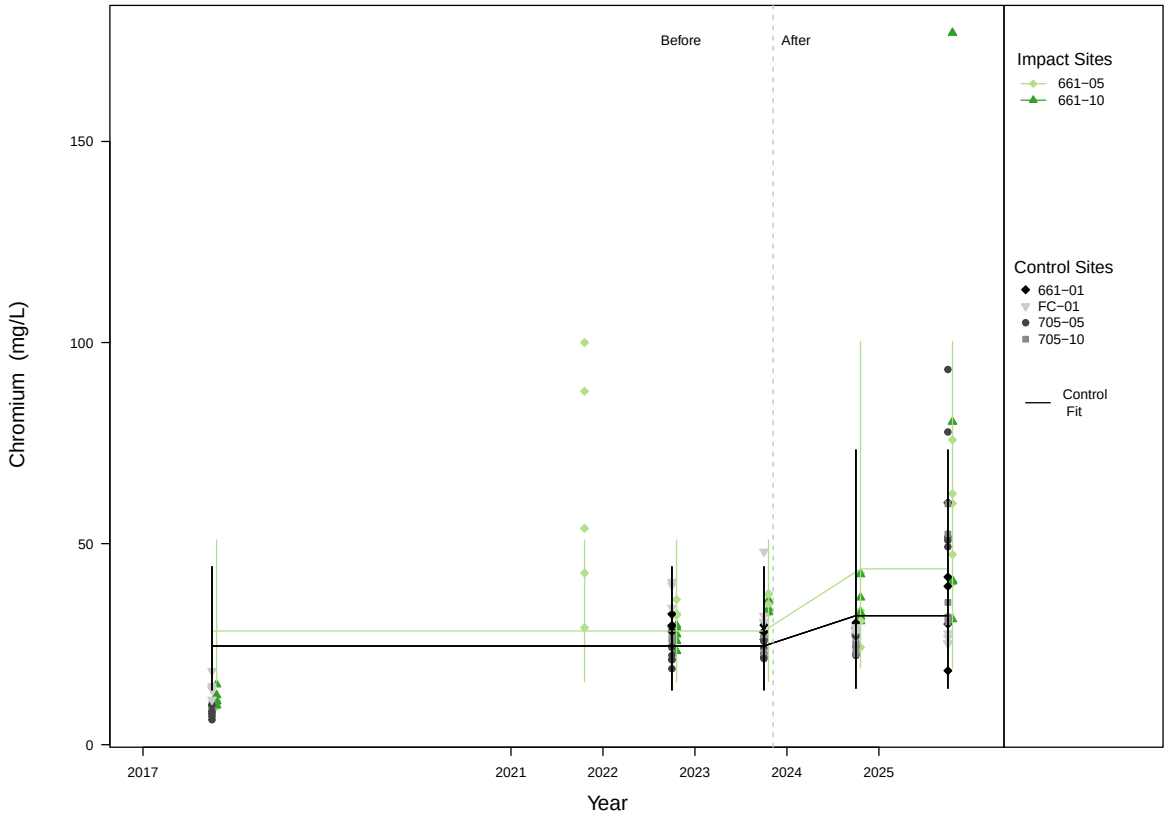
Impact vs.	Estimate	Significance
control sites	0.073	not significant

Conclusion:

The change in Chromium concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.168) different from the change at the control sites, according to the test on the BACI term (*class:period*).

2.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

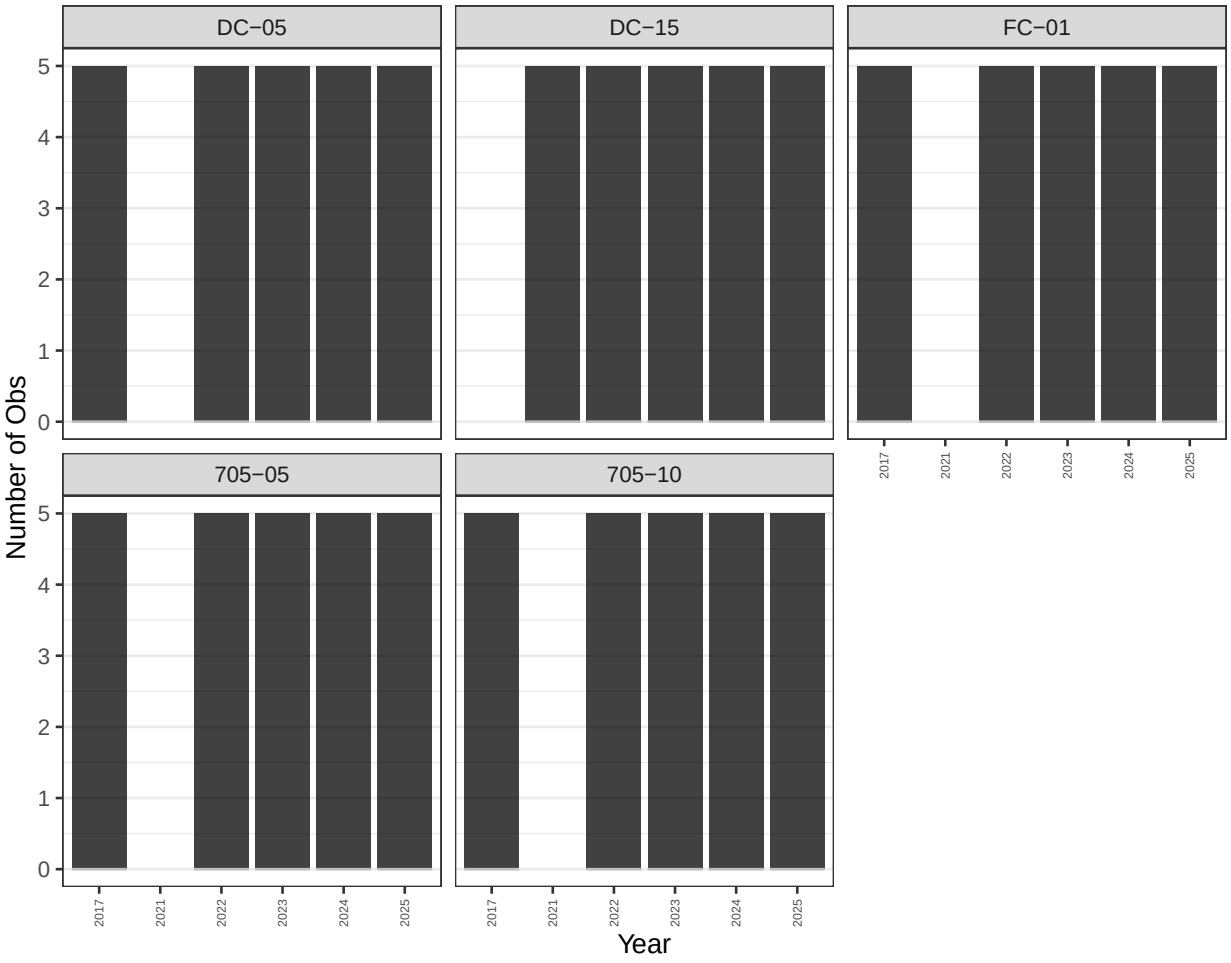
Variable	Chromium
Watershed	Creek 661
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

B-4.1.4 Copper

1 Davidson Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

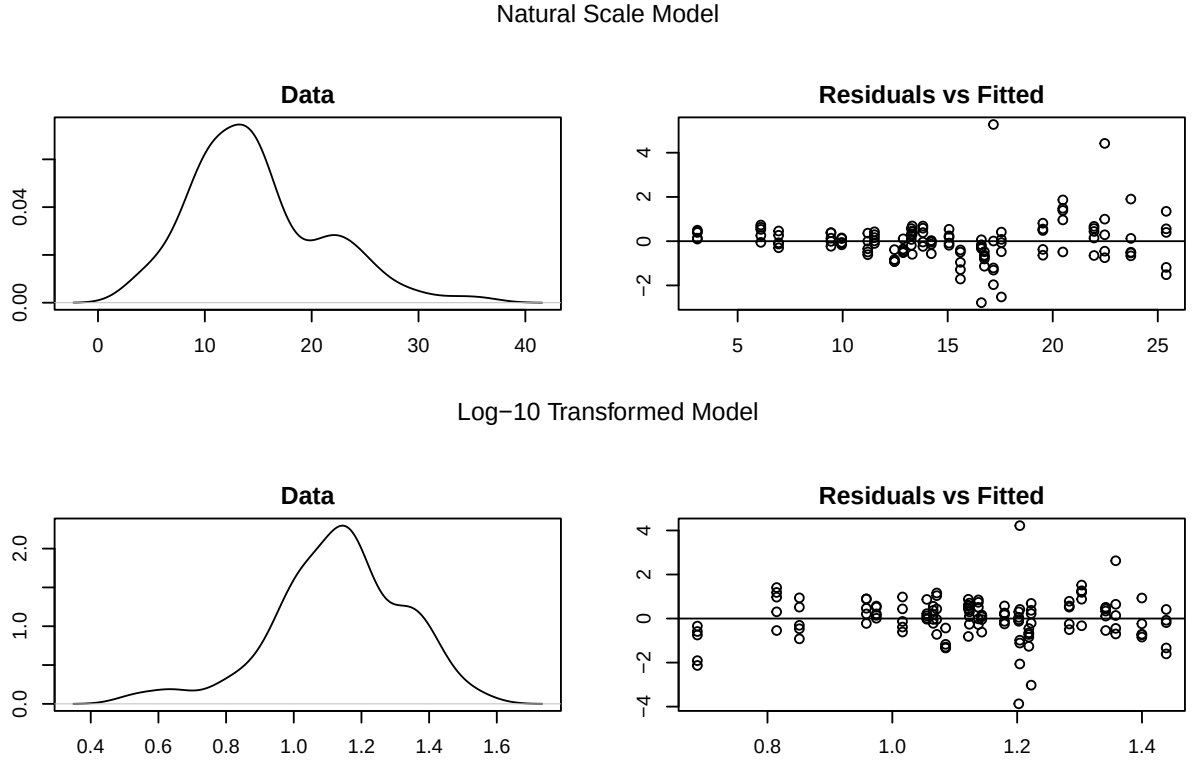
1.2 Sample Sizes for Modelling

The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Davidson Creek	DC-05	before	15	9.73	0
Davidson Creek	DC-05	after	10	18.90	0
Davidson Creek	DC-15	before	15	13.20	0
Davidson Creek	DC-15	after	10	17.20	0
Davidson Creek	FC-01	before	15	22.10	0
Davidson Creek	FC-01	after	10	24.43	0
Davidson Creek	705-05	before	15	9.42	0
Davidson Creek	705-05	after	10	10.85	0
Davidson Creek	705-10	before	15	14.50	0
Davidson Creek	705-10	after	10	14.70	0

1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	DC-15	2021	9	impact	before	33.2	17.18	5.275	Y
Davidson Creek	FC-01	2024	9	control	after	35.9	22.47	4.420	Y

Outliers on log scale:

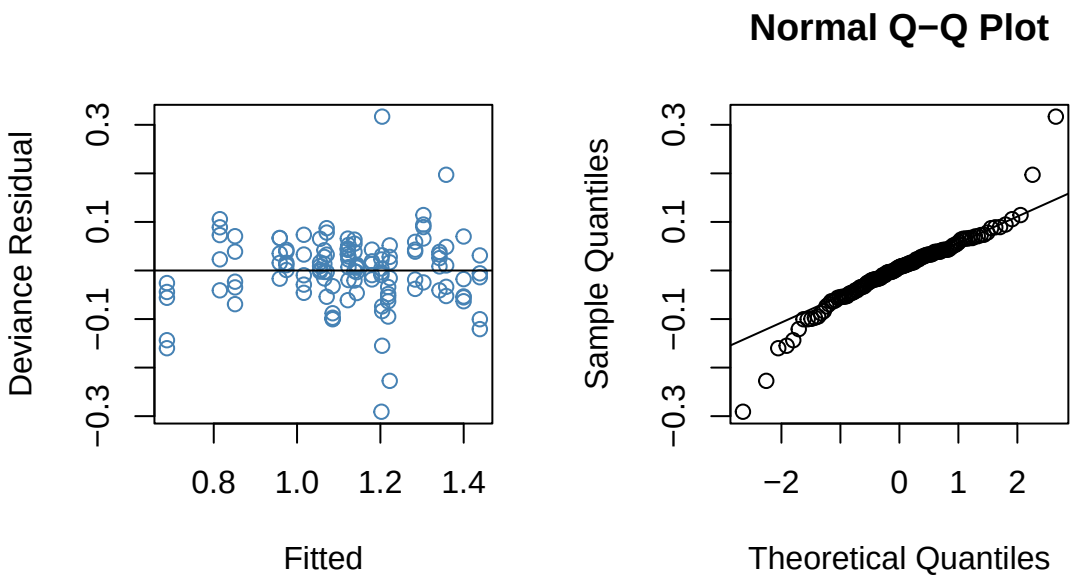
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	DC-15	2021	9	impact	before	1.5211	1.204	4.218	Y
Davidson Creek	DC-15	2024	9	impact	after	0.9117	1.203	-3.872	Y
Davidson Creek	DC-05	2024	9	impact	after	0.9952	1.222	-3.025	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	6.01e-06	6.01e-06	1	3.003	0.0011	0.976	
period	5.477e-03	5.477e-03	1	3.952	0.9705	0.381	
class:period	9.883e-02	9.883e-02	1	114.591	17.5120	<0.001	0.00146

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
125	0.0829	10%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

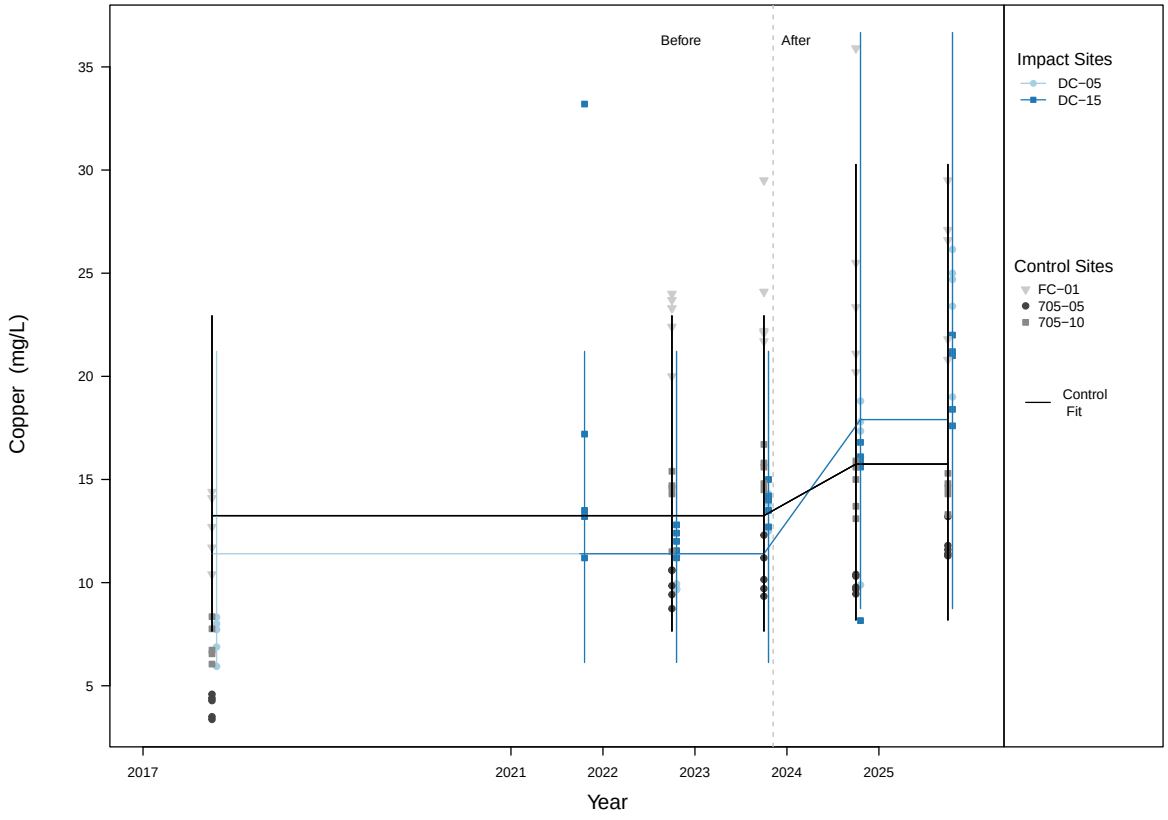
Impact vs.	Estimate	Significance
control sites	0.121	significant

Conclusion:

The change in Copper concentrations at the impact sites from *before* to *after* was significantly (*adjusted p =* 0.0015) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

Variable	Copper

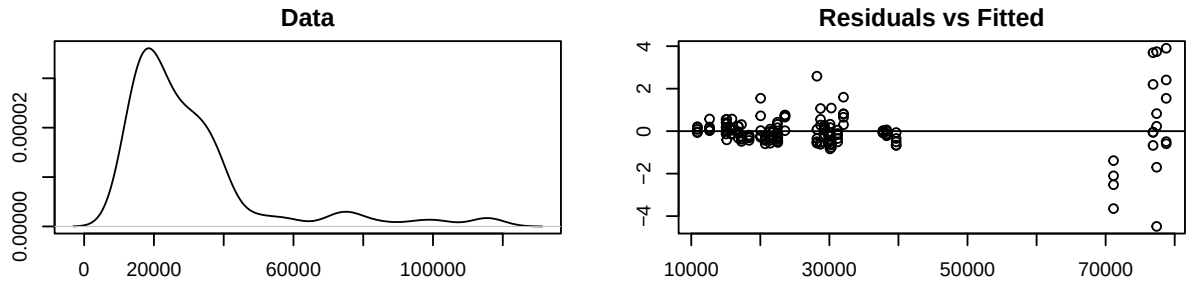
Creek 661	661-01	after	10	82700	0

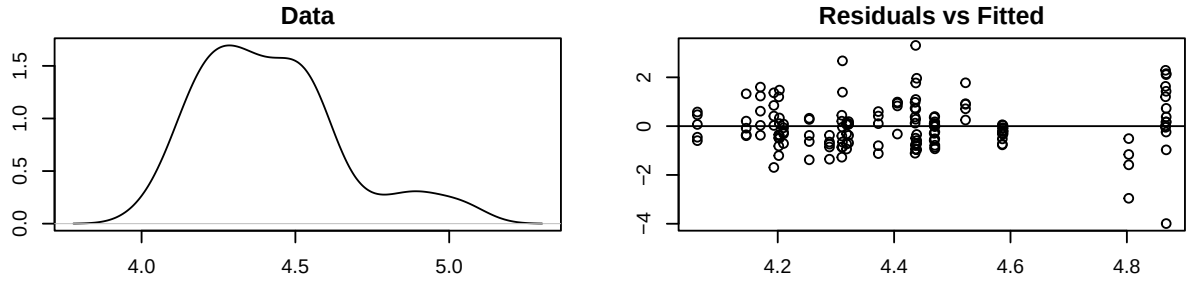
2.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-01	2025	9	control	after	32300	77387	-4.484	Y
Creek 661	661-01	2024	9	control	after	118000	78770	3.902	Y
Creek 661	661-01	2025	9	control	after	115000	77387	3.741	Y
Creek 661	661-01	2023	9	control	before	114000	76866	3.693	Y
Creek 661	661-01	2022	9	control	before	34500	71143	-3.645	Y

Outliers on log scale:

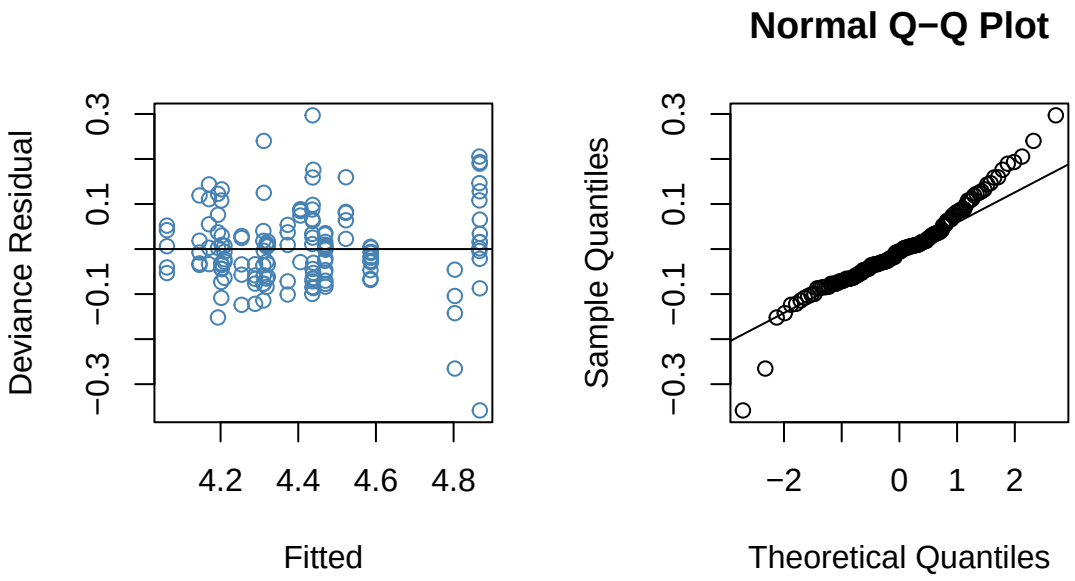
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-01	2025	9	control	after	4.509	4.868	-3.992	Y
Creek 661	705-05	2023	9	control	before	4.734	4.437	3.308	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

2.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.0378659	0.0378659	1	3.999	4.6992	0.0961	
period	0.0072577	0.0072577	1	3.747	0.9007	0.4000	
class:period	0.000416	0.000416	1	139.017	0.0517	0.8200	0.853

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
149	0.6281	100%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-05, 661-10) and control sites (661-01, FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

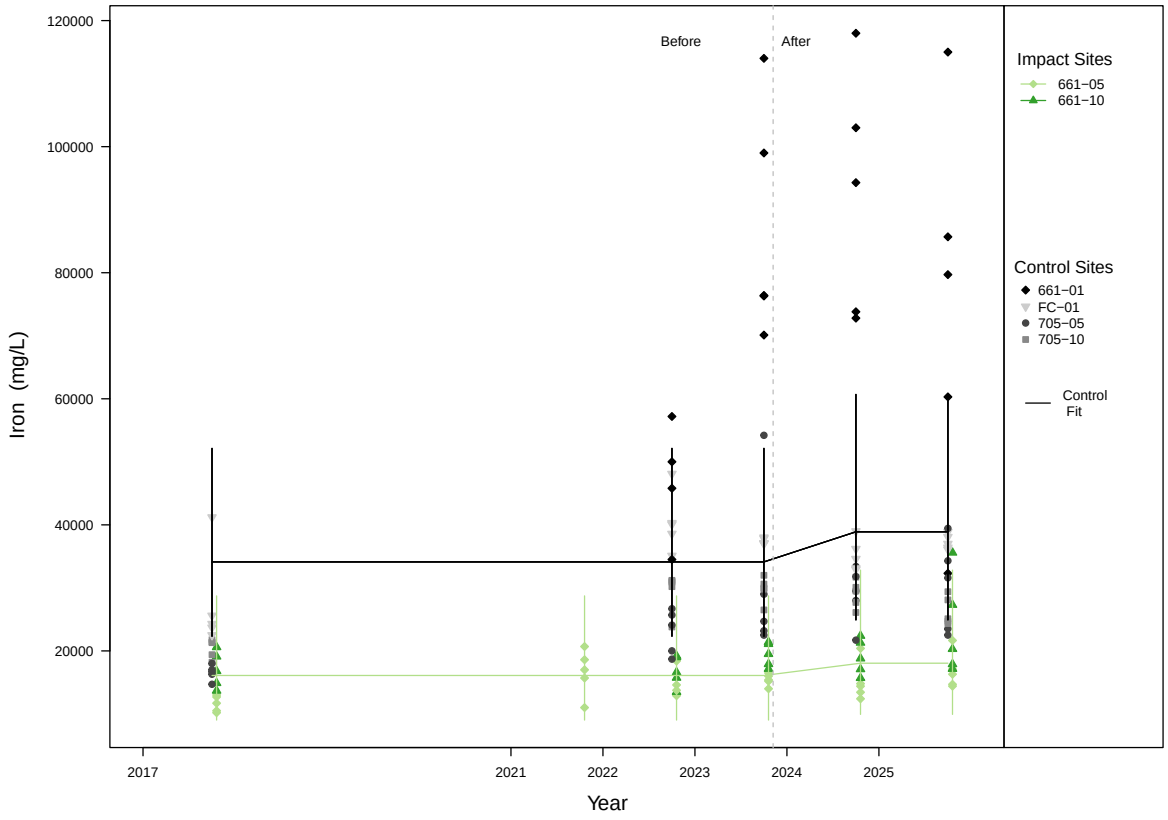
Impact vs.	Estimate	Significance
control sites	-0.0073	not significant

Conclusion:

The change in Iron concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p* = 0.853) different from the change at the control sites, according to the test on the BACI term (*class:period*).

2.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

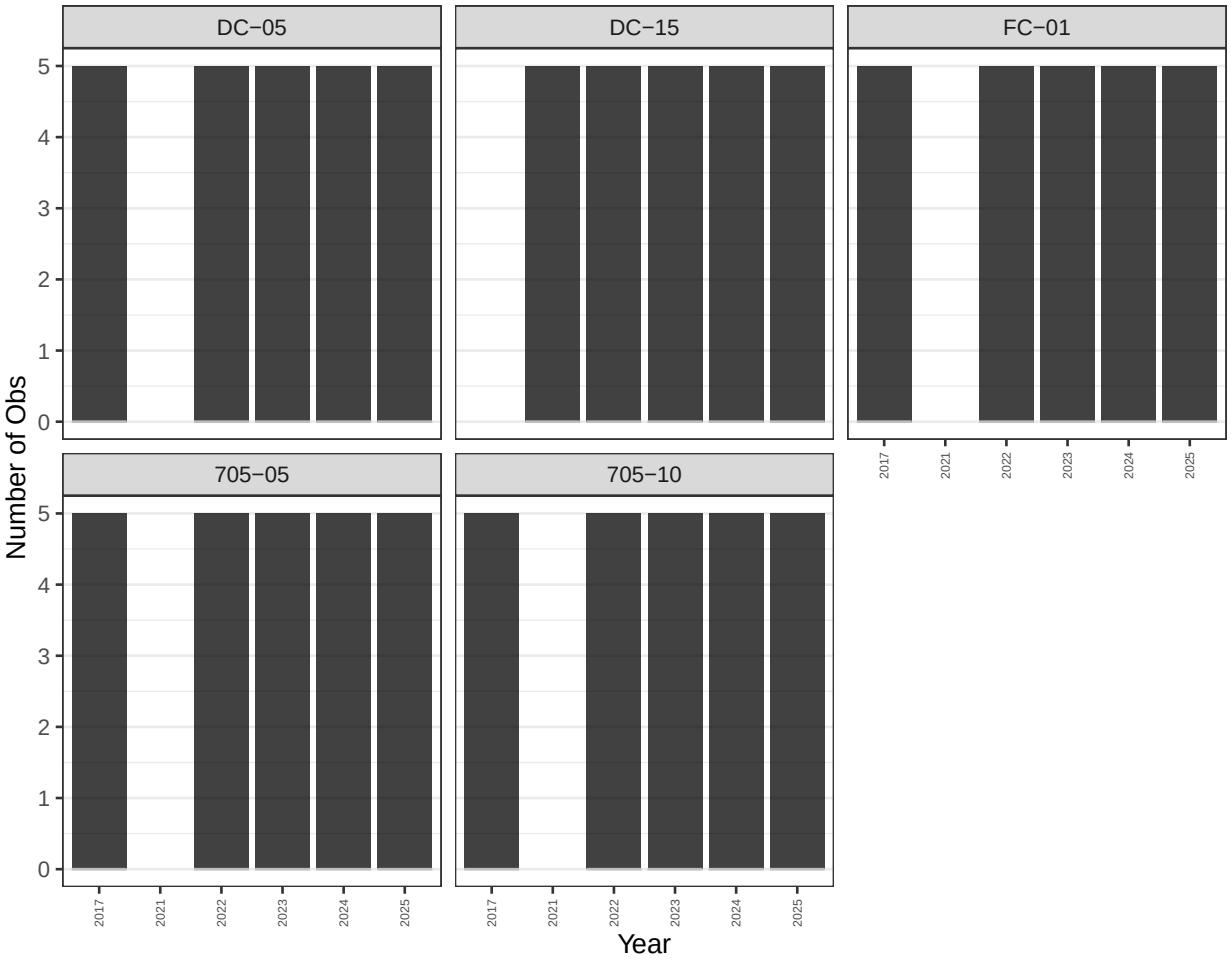
Variable	Iron
Watershed	Creek 661
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

B-4.1.6 Lead

1 Davidson Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

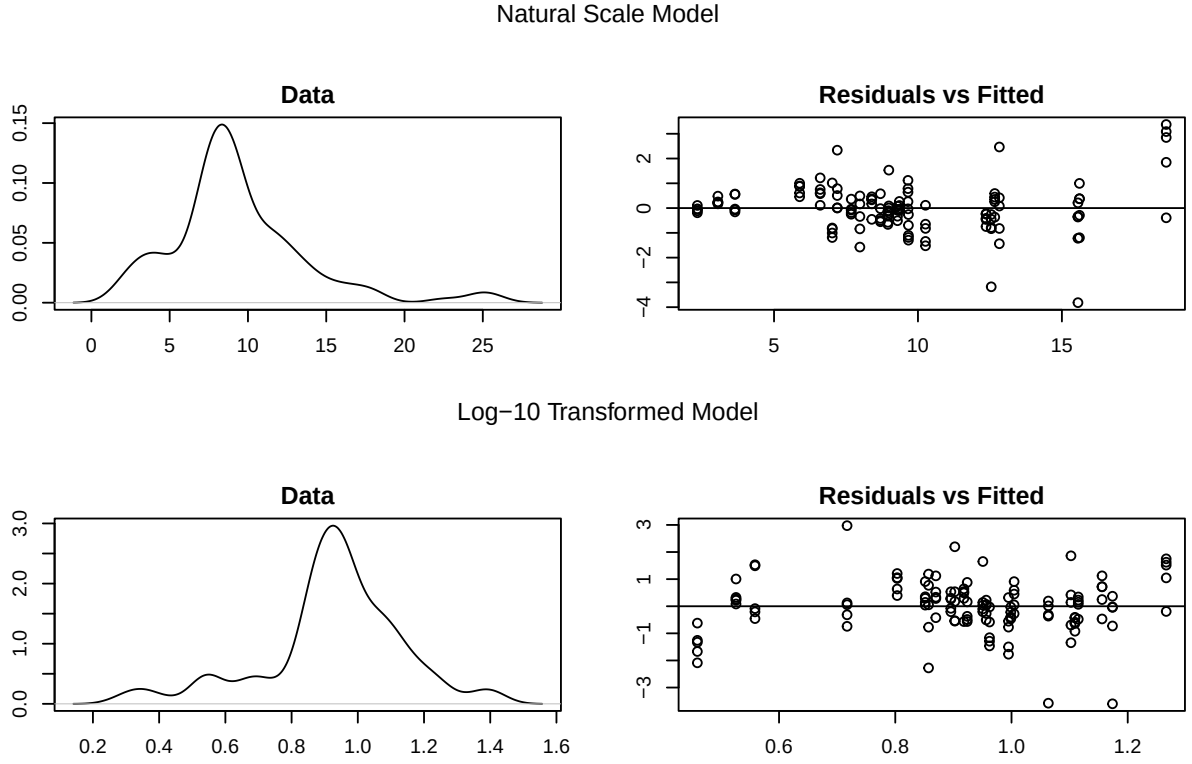
1.2 Sample Sizes for Modelling

The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Davidson Creek	DC-05	before	15	11.500	0
Davidson Creek	DC-05	after	10	16.900	0
Davidson Creek	DC-15	before	15	10.200	0
Davidson Creek	DC-15	after	10	12.550	0
Davidson Creek	FC-01	before	15	8.600	0
Davidson Creek	FC-01	after	10	8.400	0
Davidson Creek	705-05	before	15	7.160	0
Davidson Creek	705-05	after	10	7.755	0
Davidson Creek	705-10	before	15	7.650	0
Davidson Creek	705-10	after	10	7.855	0

1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	DC-05	2024	9	impact	after	7.55	15.56	-3.818	Y
Davidson Creek	DC-05	2025	9	impact	after	25.70	18.62	3.374	Y
Davidson Creek	DC-15	2024	9	impact	after	5.88	12.54	-3.177	Y
Davidson Creek	DC-05	2025	9	impact	after	25.10	18.62	3.088	Y

Outliers on log scale:

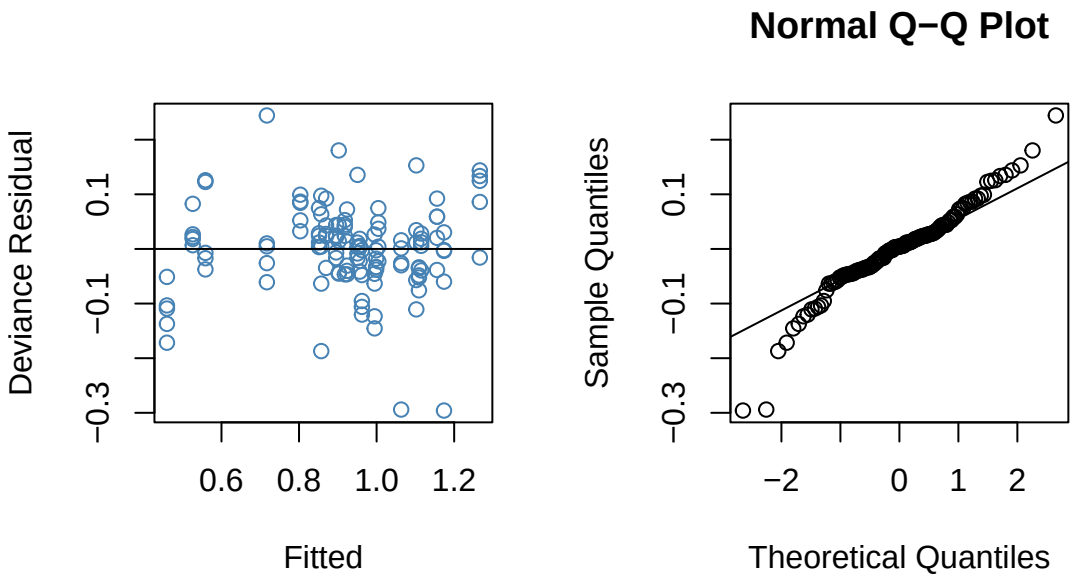
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	DC-05	2024	9	impact	after	0.8779	1.174	-3.600	Y
Davidson Creek	DC-15	2024	9	impact	after	0.7694	1.063	-3.577	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.078167	0.078167	1	3.021	11.5719	0.042	
period	0.003696	0.003696	1	3.962	0.5471	0.501	
class:period	0.086031	0.086031	1	114.592	12.7360	<0.001	0.00273

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
125	0.2644	68%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

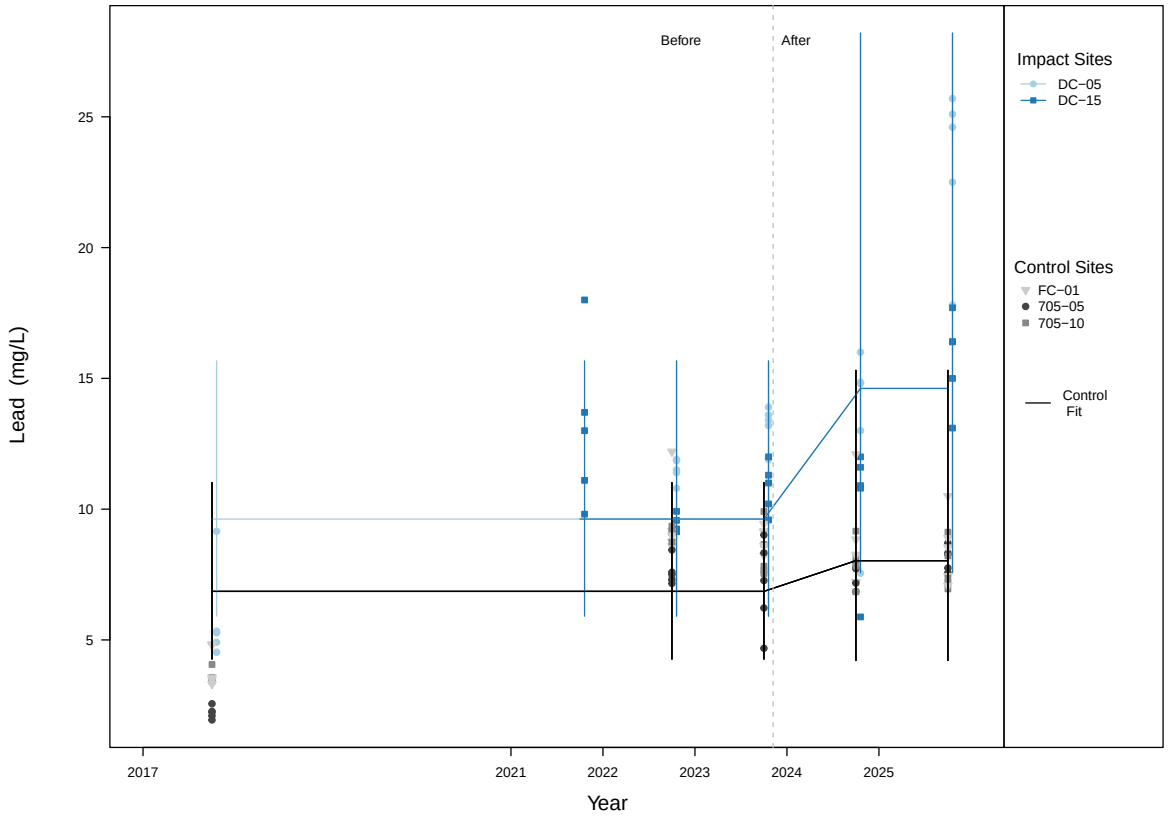
Impact vs.	Estimate	Significance
control sites	0.1129	significant

Conclusion:

The change in Lead concentrations at the impact sites from *before* to *after* was significantly (*adjusted p* = 0.0027) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

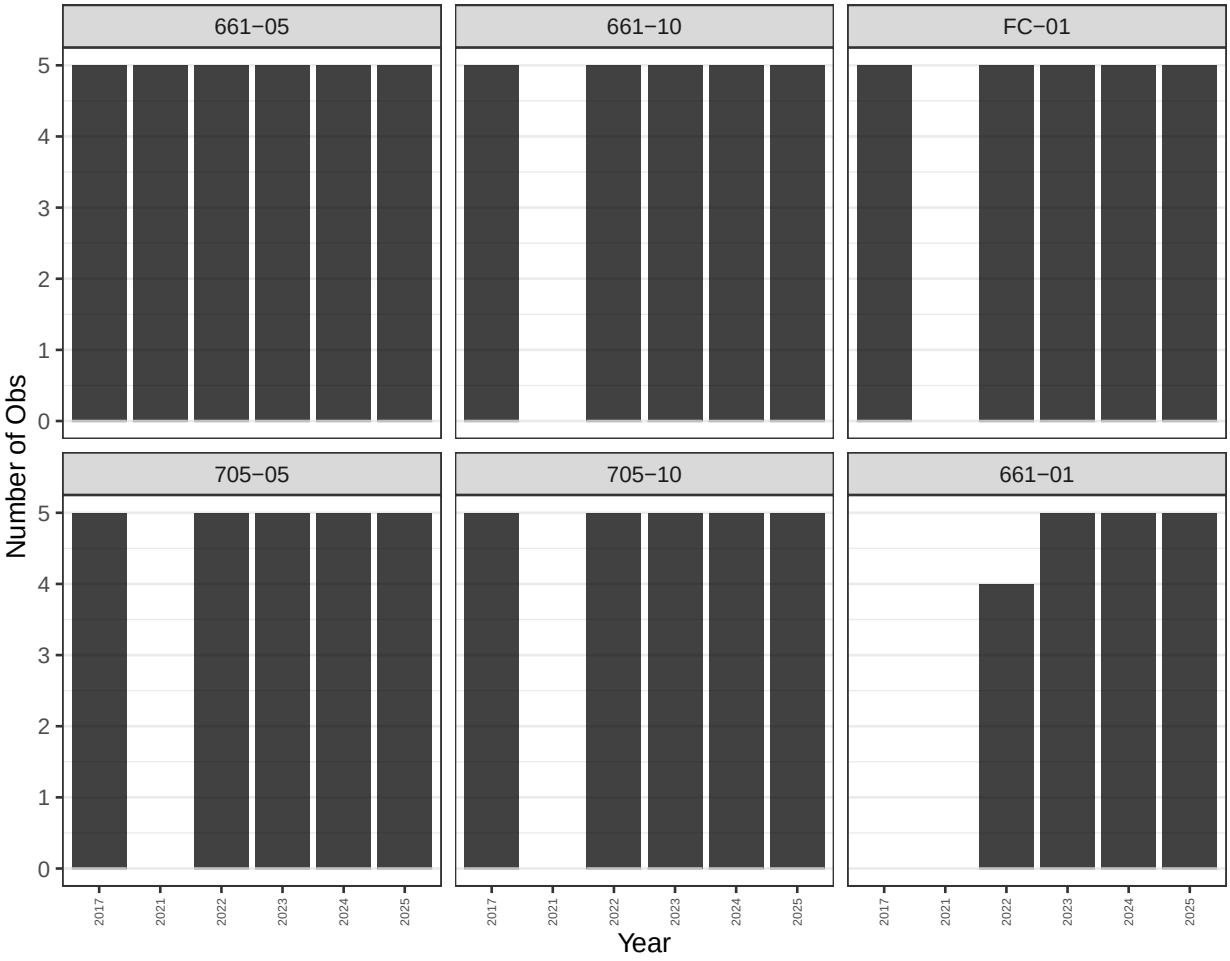
Final Summary Table

Variable	Lead
Watershed	Davidson Creek
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	Yes

2 Creek 661

2.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

2.2 Sample Sizes for Modelling

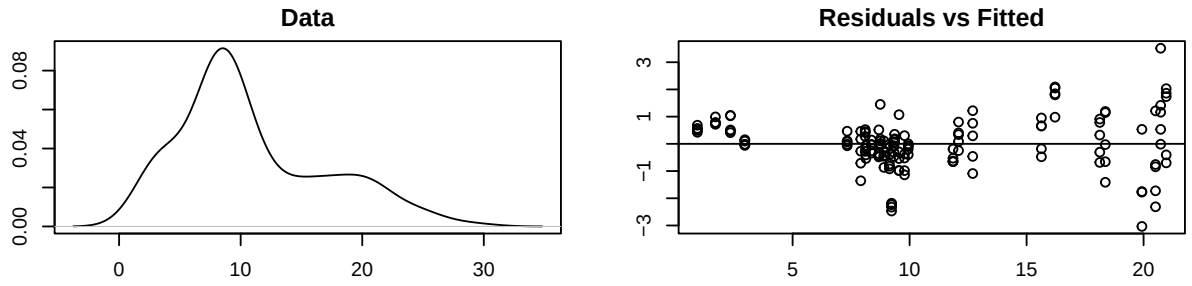
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Creek 661	661-05	before	20	9.752	0
Creek 661	661-05	after	10	11.450	0
Creek 661	661-10	before	15	17.200	0
Creek 661	661-10	after	10	18.600	0
Creek 661	FC-01	before	15	8.600	0
Creek 661	FC-01	after	10	8.400	0
Creek 661	705-05	before	15	7.160	0
Creek 661	705-05	after	10	7.755	0
Creek 661	705-10	before	15	7.650	0
Creek 661	705-10	after	10	7.855	0
Creek 661	661-01	before	9	16.400	0
Creek 661	661-01	after	10	23.800	0

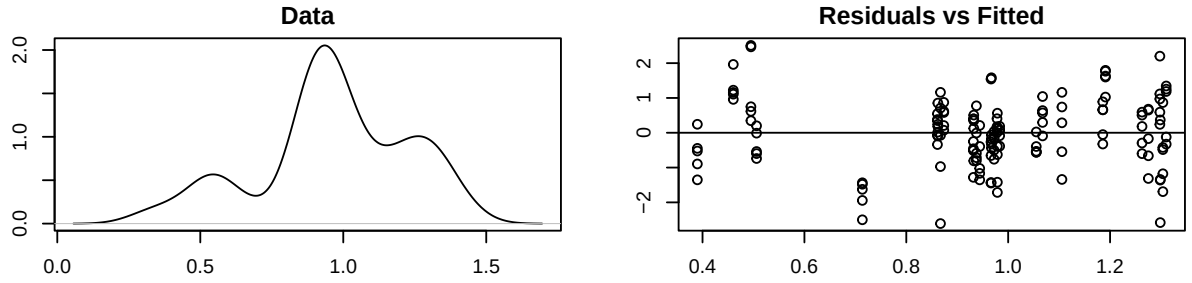
2.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-01	2024	9	control	after	29.1	20.73	3.513	Y
Creek 661	661-01	2022	9	control	before	12.7	19.93	-3.034	Y

Outliers on log scale:

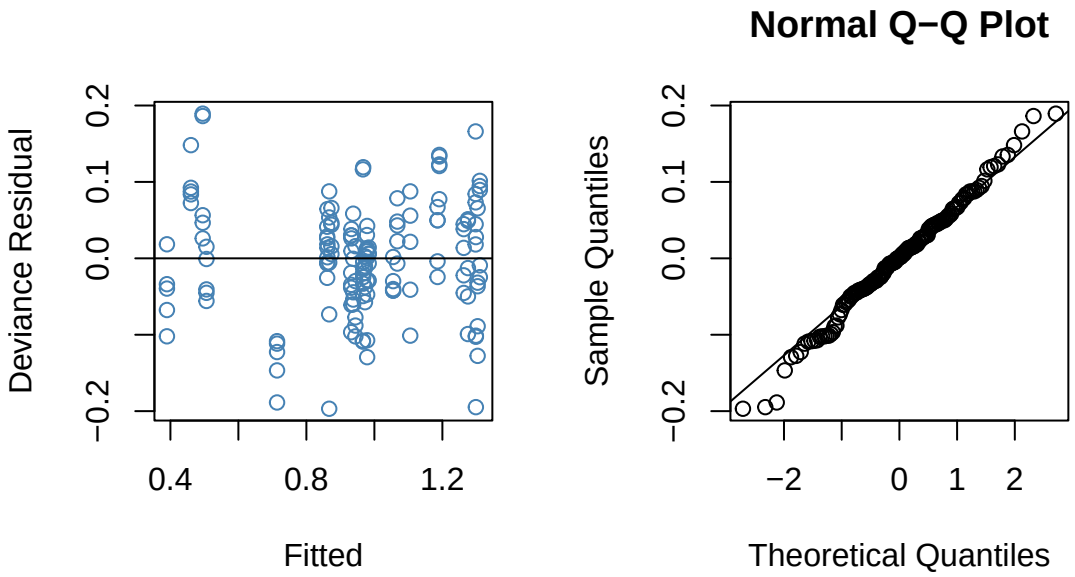
None

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

2.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.002493	0.002493	1	4.000	0.4377	0.5440	
period	0.002379	0.002379	1	3.982	0.4176	0.5530	
class:period	0.047353	0.047353	1	137.197	8.3135	0.0046	0.0132

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test

149	0.0603	8%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-05, 661-10) and control sites (661-01, FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

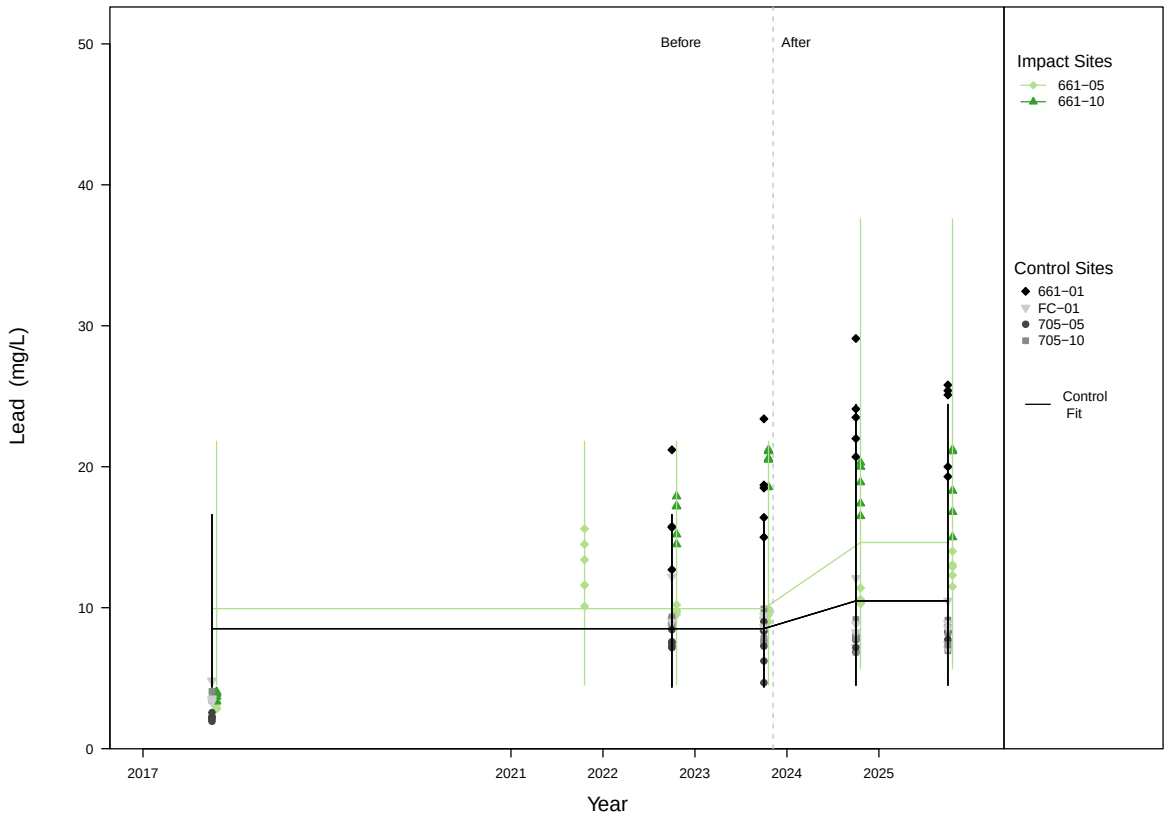
Impact vs.	Estimate	Significance
control sites	0.0777	significant

Conclusion:

The change in Lead concentrations at the impact sites from *before* to *after* was significantly (*adjusted p =* 0.0132) different from the change at the control sites, according to the test on the BACI term (*class:period*).

2.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

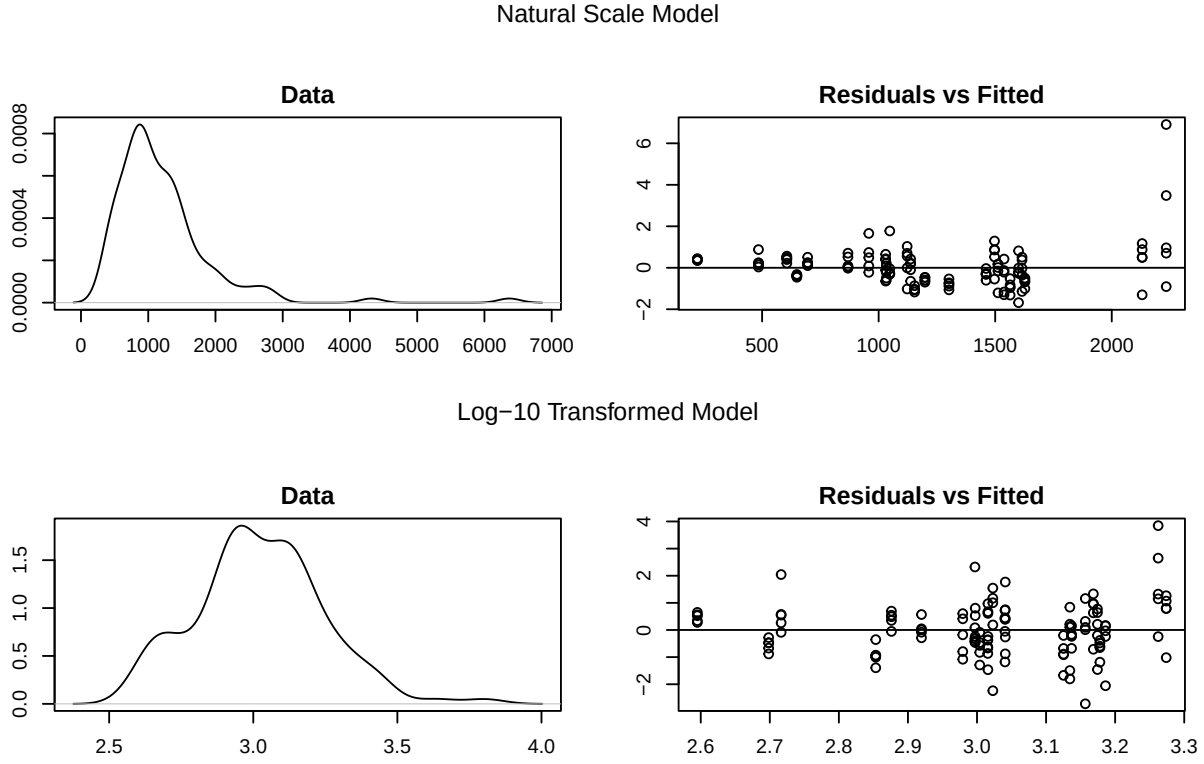
Davidson Creek	705-10	after	10	1175.0	0

1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	705-05	2025	9	control	after	6370	2234	6.908	Y
Davidson Creek	705-05	2025	9	control	after	4320	2234	3.484	Y

Outliers on log scale:

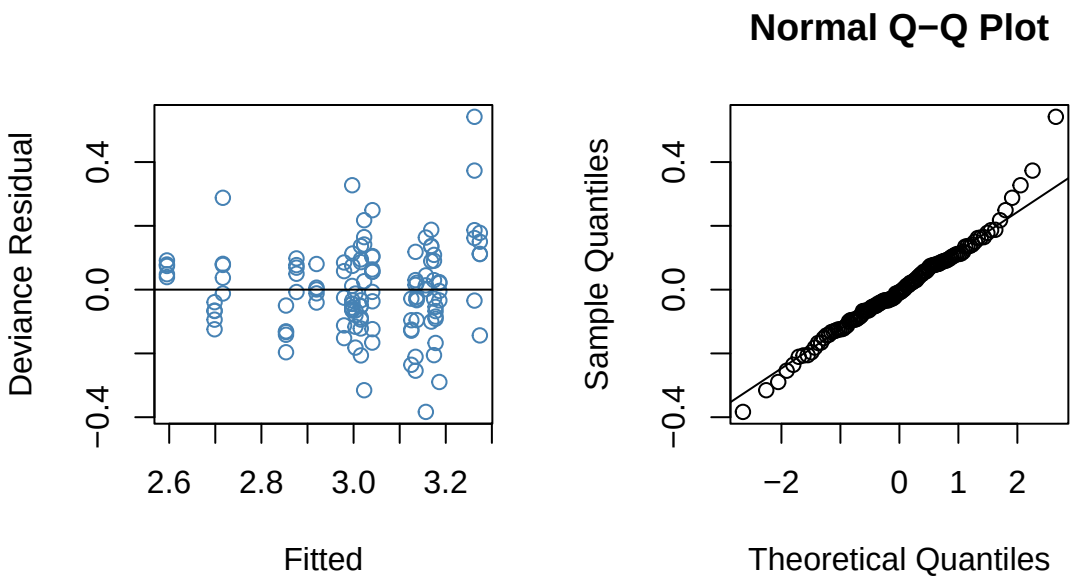
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	705-05	2025	9	control	after	3.804	3.262	3.846	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.000198	0.000198	1	3.020	0.010	0.927	
period	0.0604261	0.0604261	1	3.815	3.044	0.159	
class:period	0.0165958	0.0165958	1	115.999	0.836	0.362	0.496

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
125	0.2102	47%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

Impact vs.	Estimate	Significance
control sites	0.0495	not significant

Conclusion:

The change in Manganese concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p* = 0.496) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.

Initially a model was fit to all sites to assess the need for transformations.

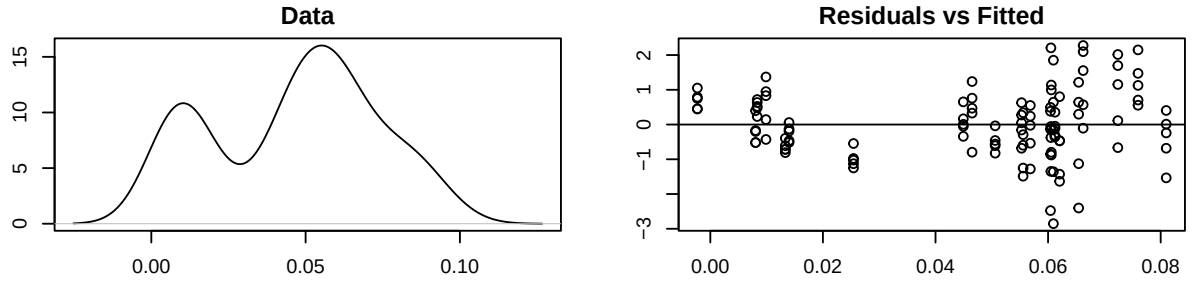
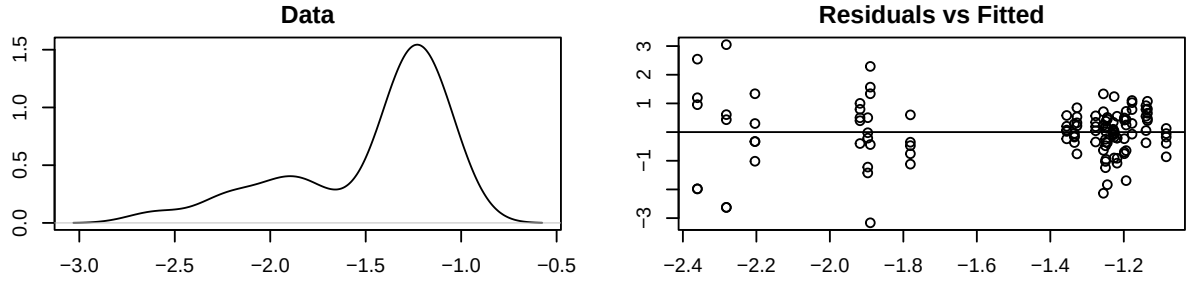
Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-01	2025	9	control	after	0.0569	0.1316	-4.101	Y
Creek 661	661-01	2024	9	control	after	0.0585	0.1184	-3.288	Y
Creek 661	661-01	2025	9	control	after	0.1880	0.1316	3.100	Y

Outliers on log scale:

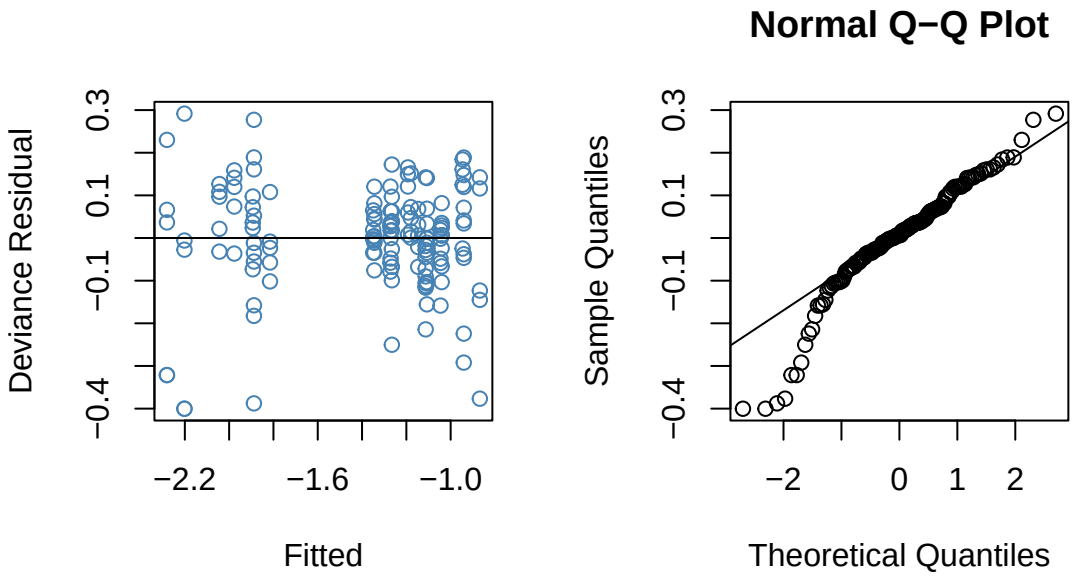
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	705-05	2017	9	control	before	-2.602	-2.202	-3.072	N
Creek 661	705-05	2017	9	control	before	-2.602	-2.202	-3.072	N

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

2.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.011943	0.011943	1	3.998	0.7034	0.449	
period	0.009945	0.009945	1	3.981	0.5858	0.487	
class:period	0.039940	0.039940	1	132.208	2.3524	0.127	0.207

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
144	0.1078	16%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-05, 661-10) and control sites (661-01, FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

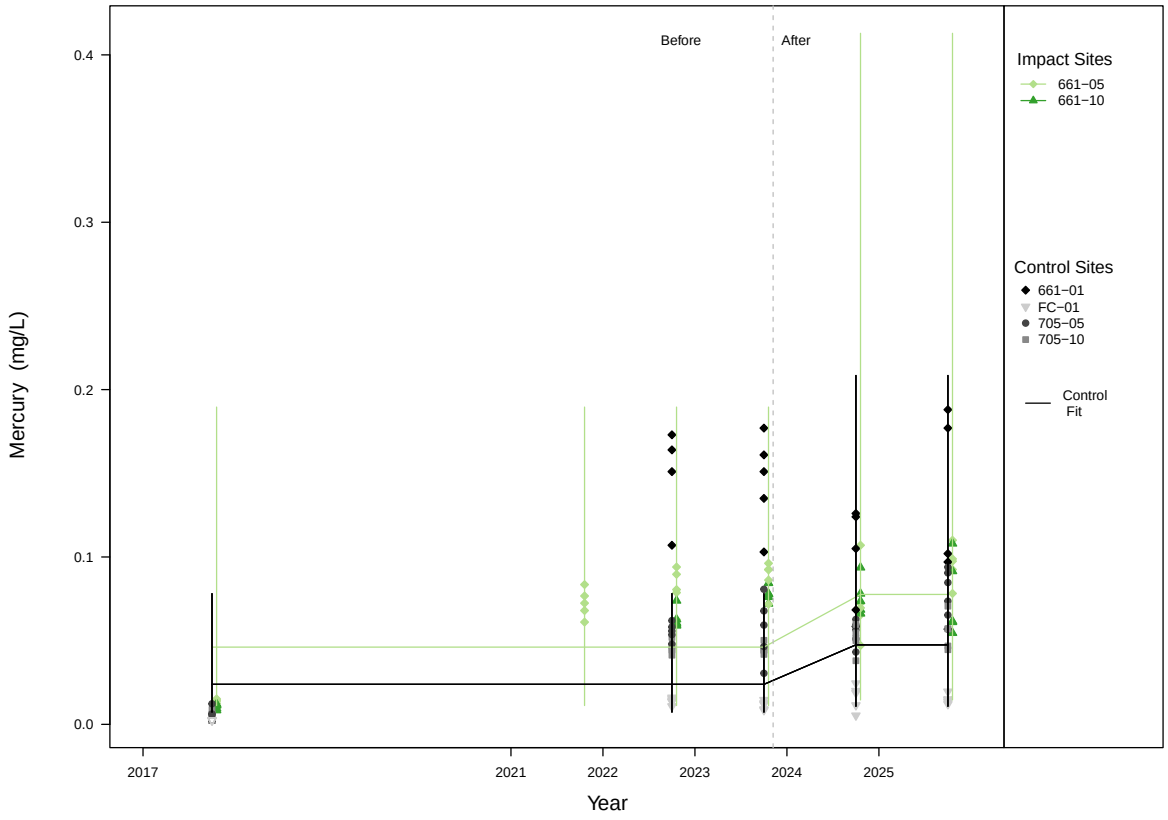
Impact vs.	Estimate	Significance
control sites	-0.0723	not significant

Conclusion:

The change in Mercury concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.207) different from the change at the control sites, according to the test on the BACI term (*class:period*).

2.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of

data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

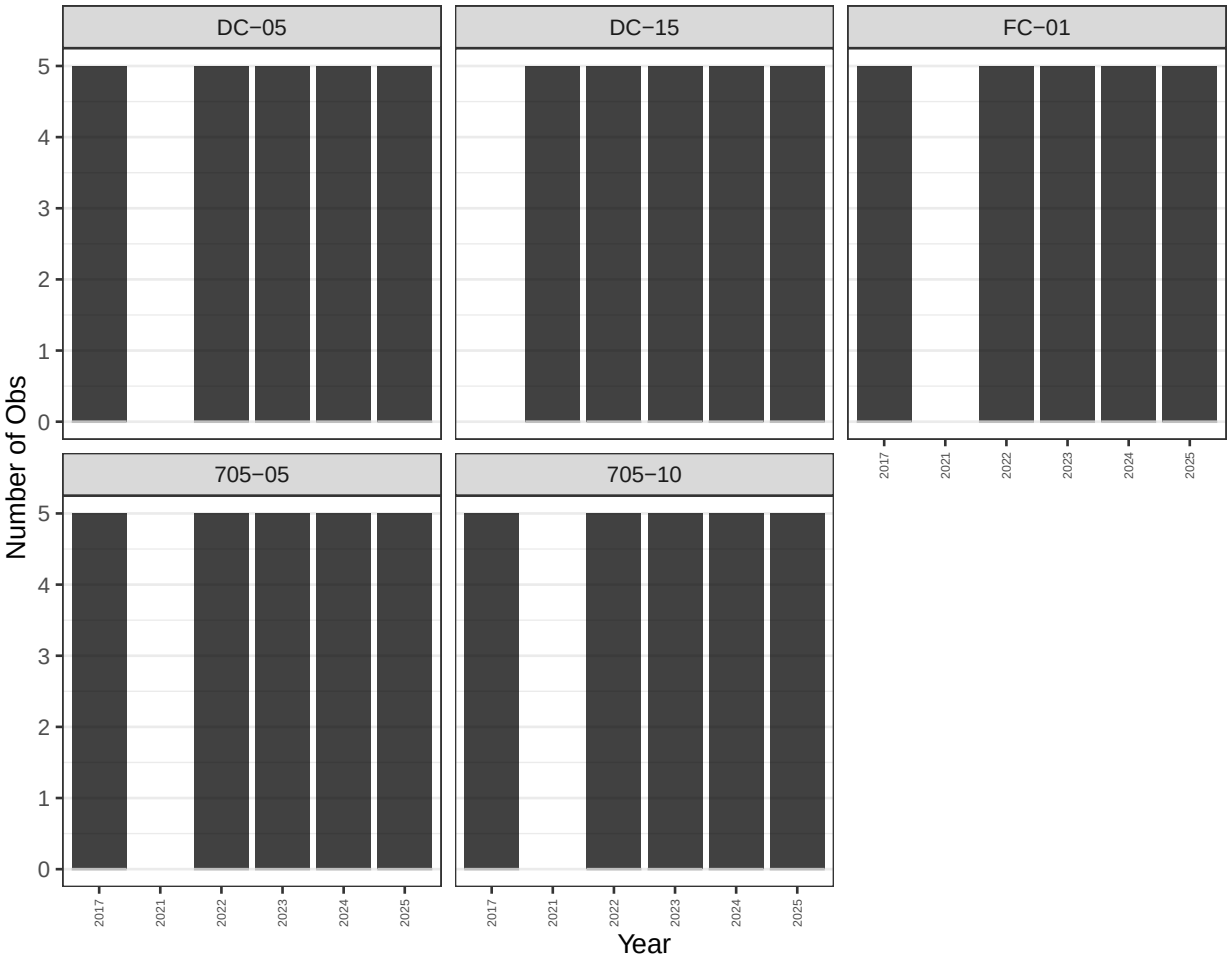
Variable	Mercury
Watershed	Creek 661
Waterbody	Stream
Streams Removed	DC-05, DC-15
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

B-4.1.9 Molybdenum

1 Davidson Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

1.2 Sample Sizes for Modelling

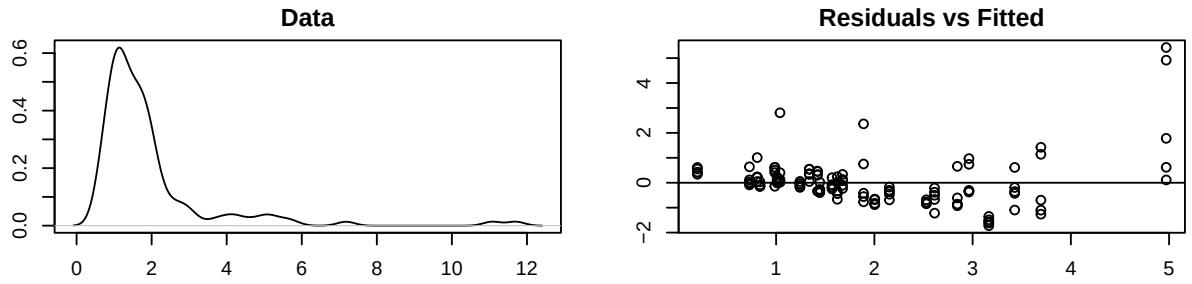
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Davidson Creek	DC-05	before	15	1.070	0
Davidson Creek	DC-05	after	10	2.250	0
Davidson Creek	DC-15	before	15	1.190	0
Davidson Creek	DC-15	after	10	1.555	0
Davidson Creek	FC-01	before	15	1.070	0
Davidson Creek	FC-01	after	10	1.212	0
Davidson Creek	705-05	before	15	1.760	0
Davidson Creek	705-05	after	10	4.650	0
Davidson Creek	705-10	before	15	1.400	0
Davidson Creek	705-10	after	10	2.035	0

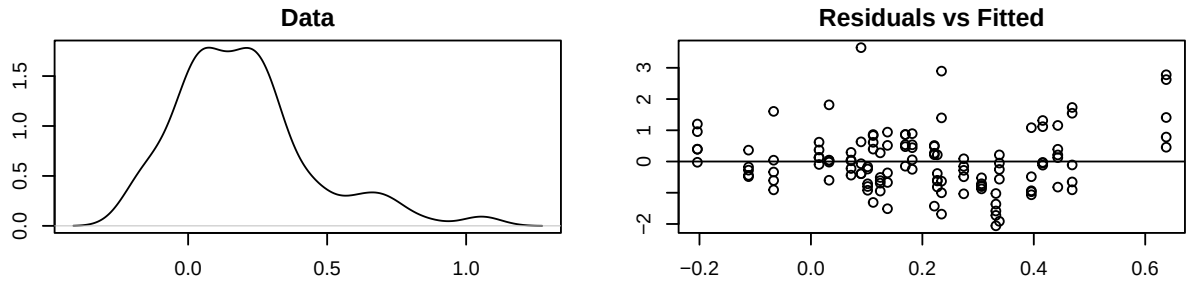
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	705-05	2025	9	control	after	11.70	4.97	5.426	Y
Davidson Creek	705-05	2025	9	control	after	11.07	4.97	4.918	Y

Outliers on log scale:

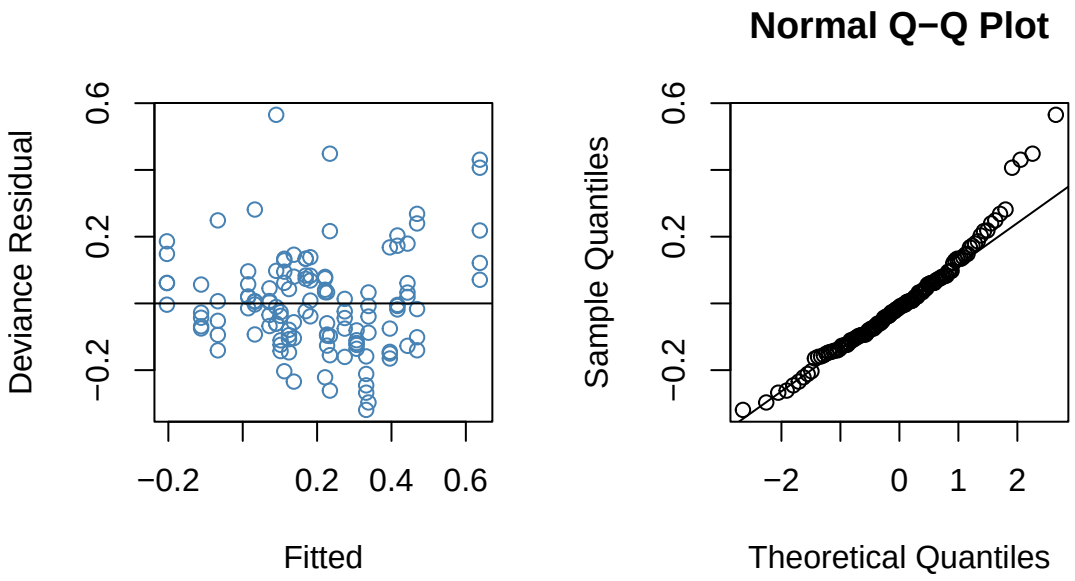
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	FC-01	2023	9	control	before	0.6551	0.0899	3.646	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.0192182	0.0192182	1	3.016	0.7996	0.437	
period	0.0326842	0.0326842	1	3.865	1.3598	0.310	
class:period	0.000411	0.000411	1	115.560	0.0171	0.896	0.896

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
125	0.1548	27%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

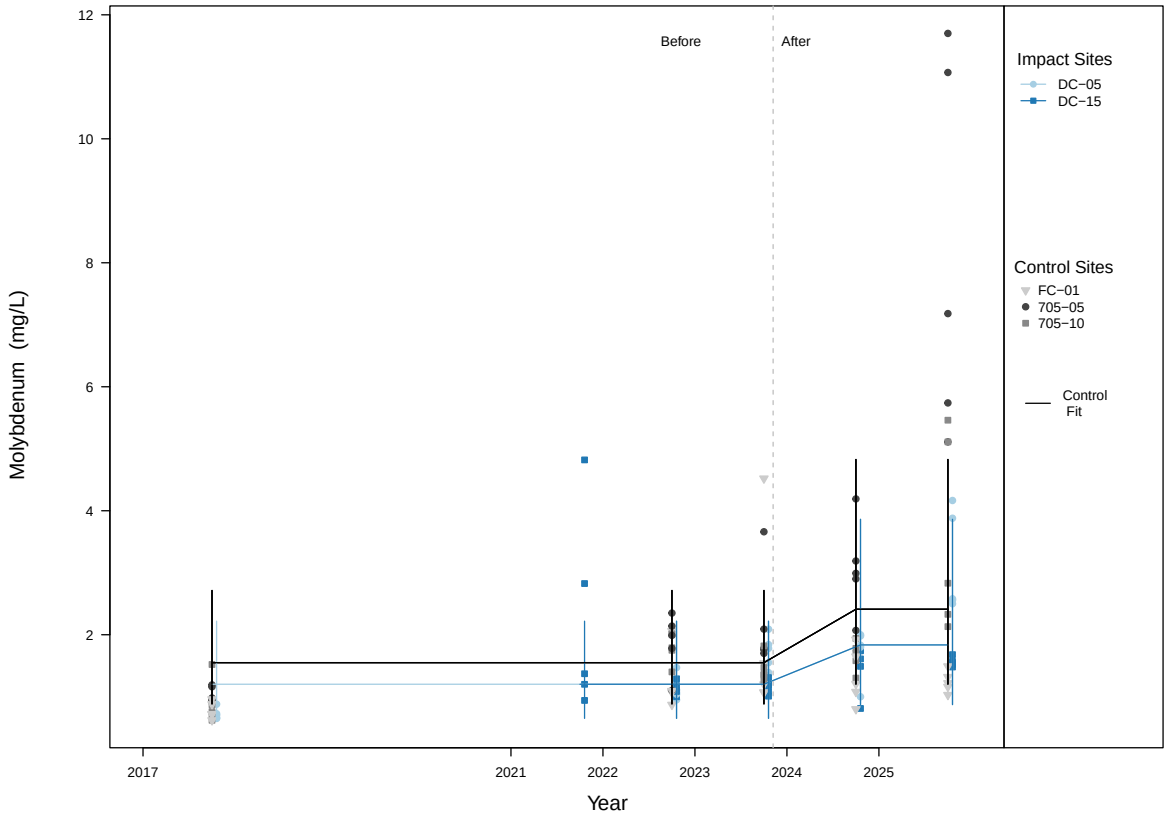
Impact vs.	Estimate	Significance
control sites	-0.0078	not significant

Conclusion:

The change in Molybdenum concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.896) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

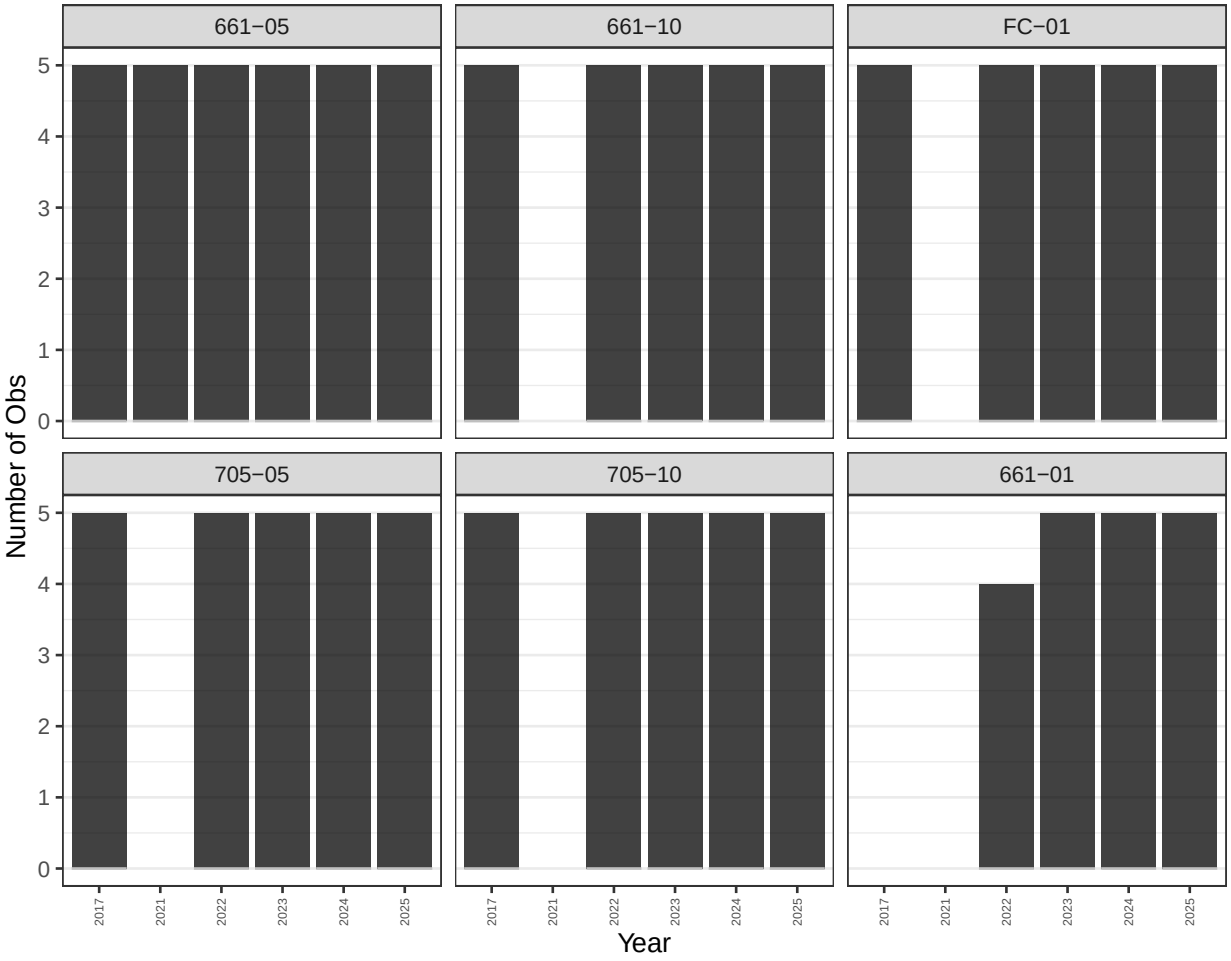
Final Summary Table

Variable	Molybdenum
Watershed	Davidson Creek
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

2 Creek 661

2.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

2.2 Sample Sizes for Modelling

The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Creek 661	661-05	before	20	0.970	0
Creek 661	661-05	after	10	1.785	0
Creek 661	661-10	before	15	0.700	0
Creek 661	661-10	after	10	2.095	0
Creek 661	FC-01	before	15	1.070	0
Creek 661	FC-01	after	10	1.212	0

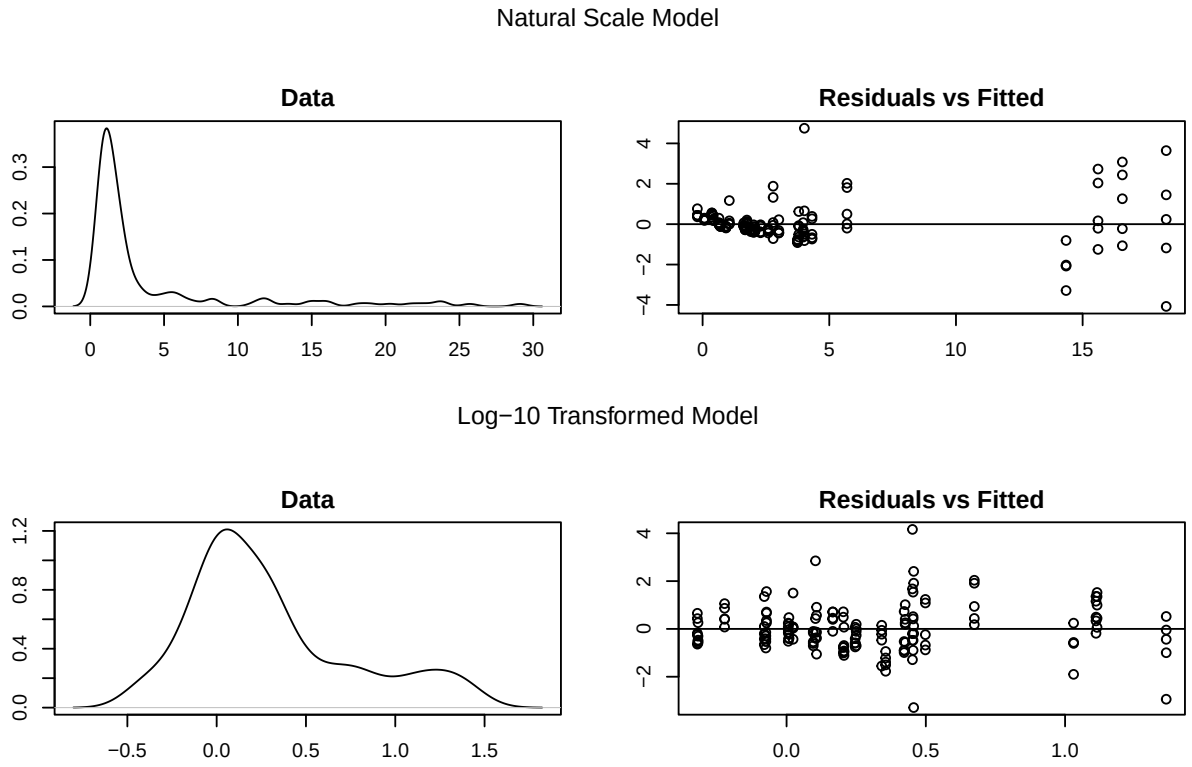
Creek 661	661-01	before	9	11.950	0
Creek 661	661-01	after	10	19.650	0

2.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-10	2025	9	impact	after	18.10	4.017	4.749	Y
Creek 661	661-01	2025	9	control	after	6.22	18.298	-4.073	Y
Creek 661	661-01	2025	9	control	after	29.10	18.298	3.642	Y
Creek 661	661-01	2022	9	control	before	4.60	14.346	-3.286	Y
Creek 661	661-01	2024	9	control	after	25.70	16.567	3.079	Y

Outliers on log scale:

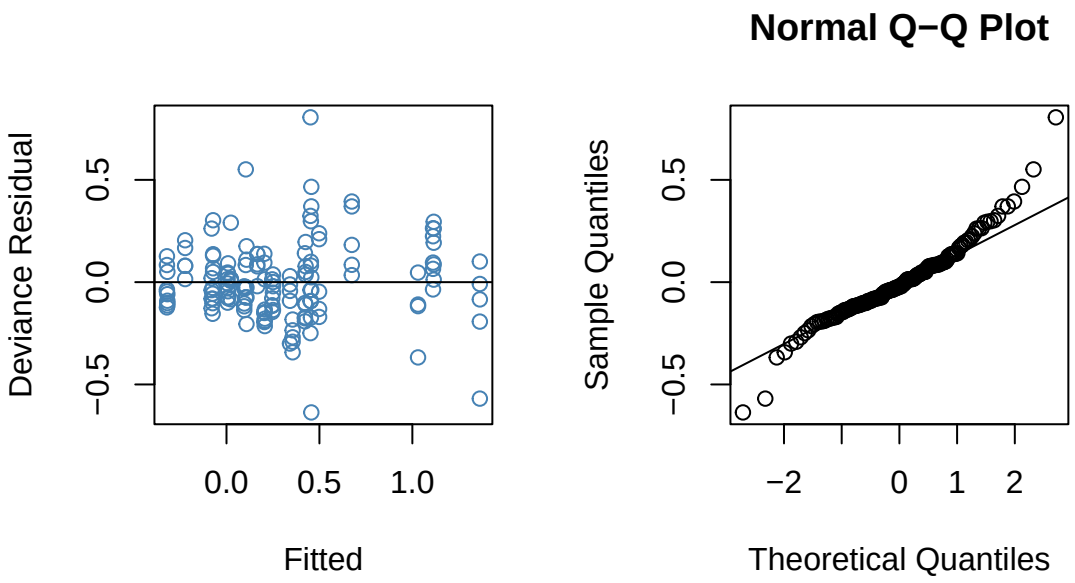
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-10	2025	9	impact	after	1.2577	0.4520	4.163	Y
Creek 661	661-05	2021	9	impact	before	-0.1805	0.4564	-3.290	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

2.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.04403	0.04403	1	3.999	1.1753	0.3390	
period	0.02538	0.02538	1	3.933	0.6774	0.4570	
class:period	0.29486	0.29486	1	137.671	7.8712	0.0058	0.015

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
149	0.1735	39%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-05, 661-10) and control sites (661-01, FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

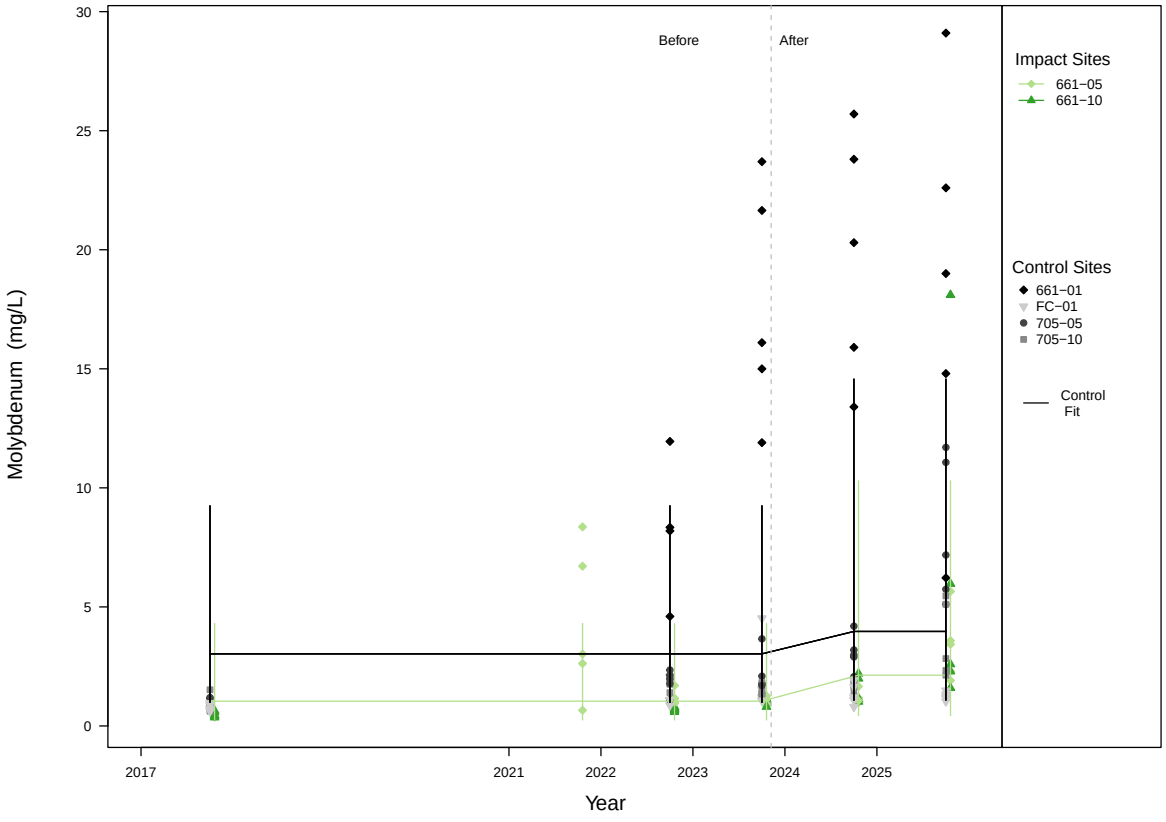
Impact vs.	Estimate	Significance
control sites	0.194	significant

Conclusion:

The change in Molybdenum concentrations at the impact sites from *before* to *after* was significantly (*adjusted p =* 0.015) different from the change at the control sites, according to the test on the BACI term (*class:period*).

2.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

Variable	Molybdenum

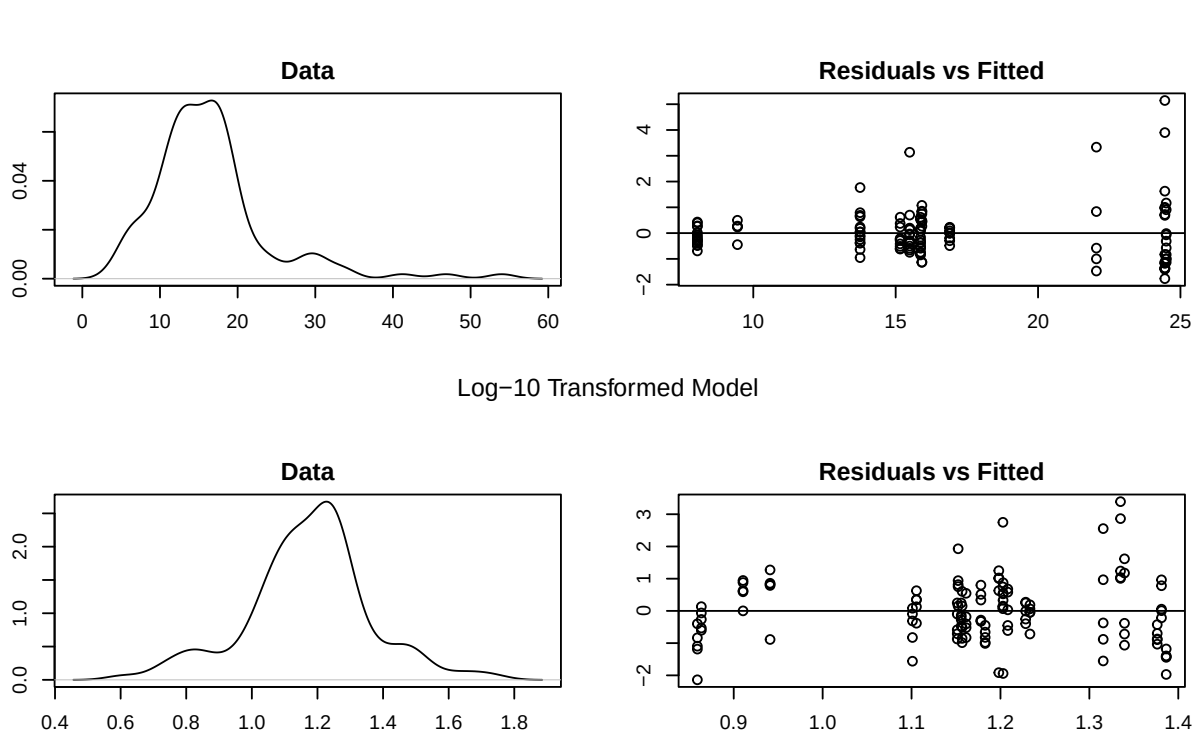
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	DC-05	2023	9	impact	before	1.11	0.6607	3.689	Y
Davidson Creek	DC-05	2023	9	impact	before	1.10	0.6607	3.607	Y

Outliers on log scale:

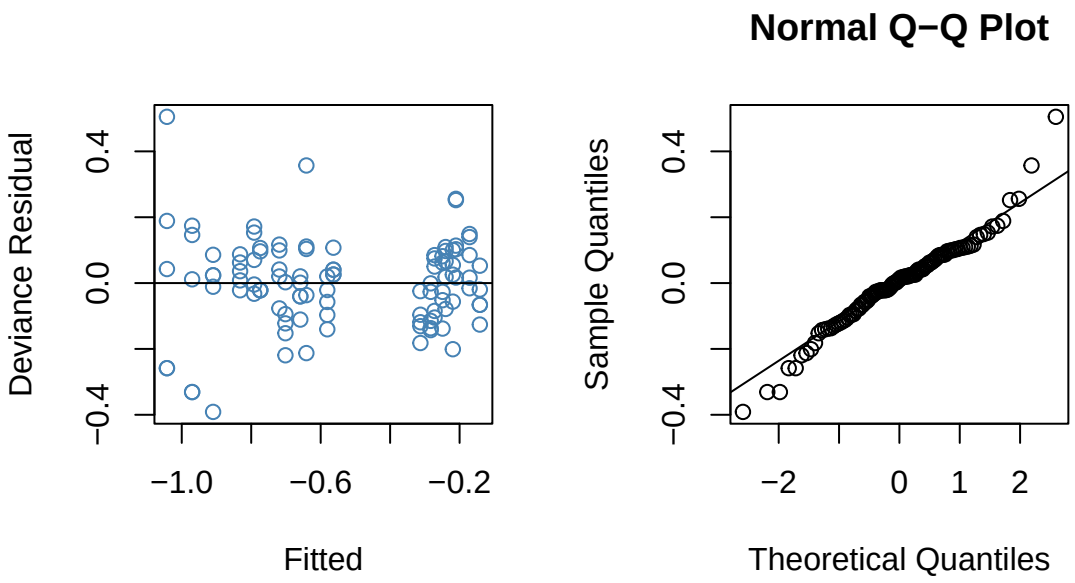
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	705-05	2022	9	control	before	-0.5376	-1.043	3.635	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.39161	0.39161	1	2.995	20.291	0.0205	
period	0.05707	0.05707	1	2.562	2.957	0.1990	
class:period	0.02905	0.02905	1	97.719	1.505	0.2230	0.341

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
105	1.92	100%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

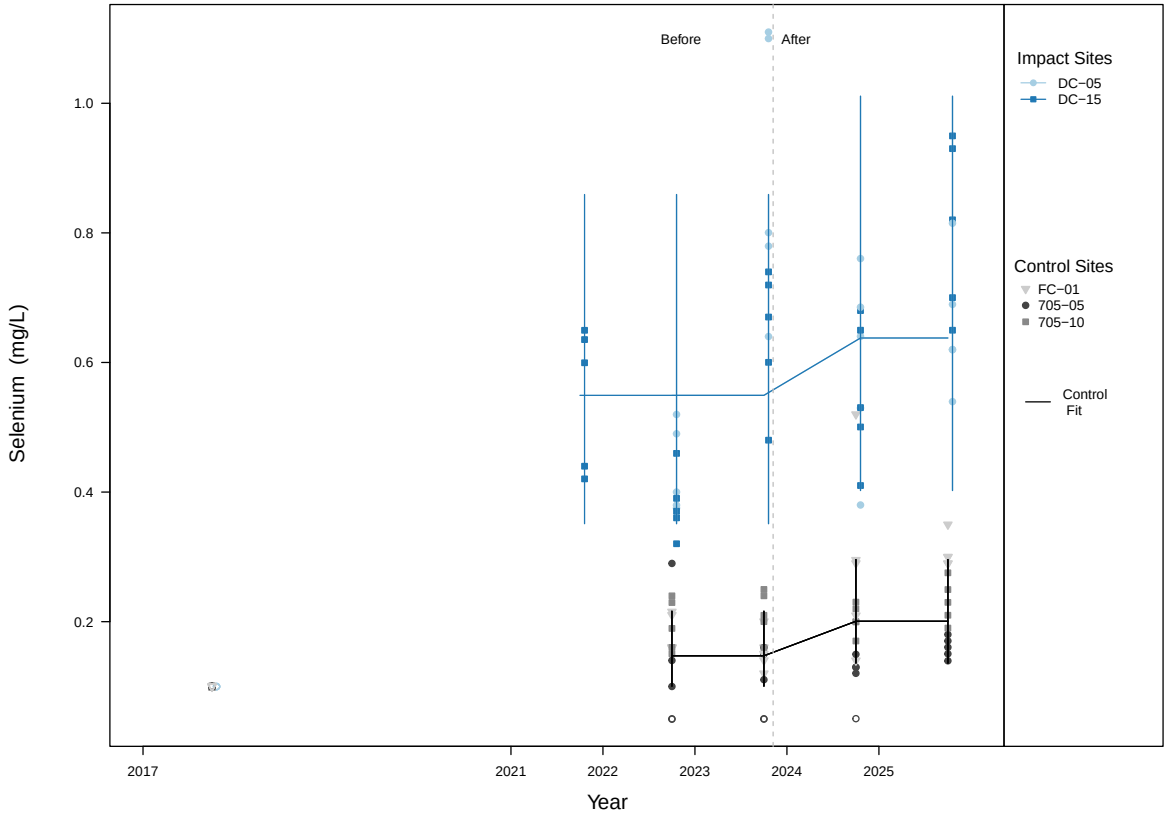
Impact vs.	Estimate	Significance
control sites	-0.0691	not significant

Conclusion:

The change in Selenium concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.341) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

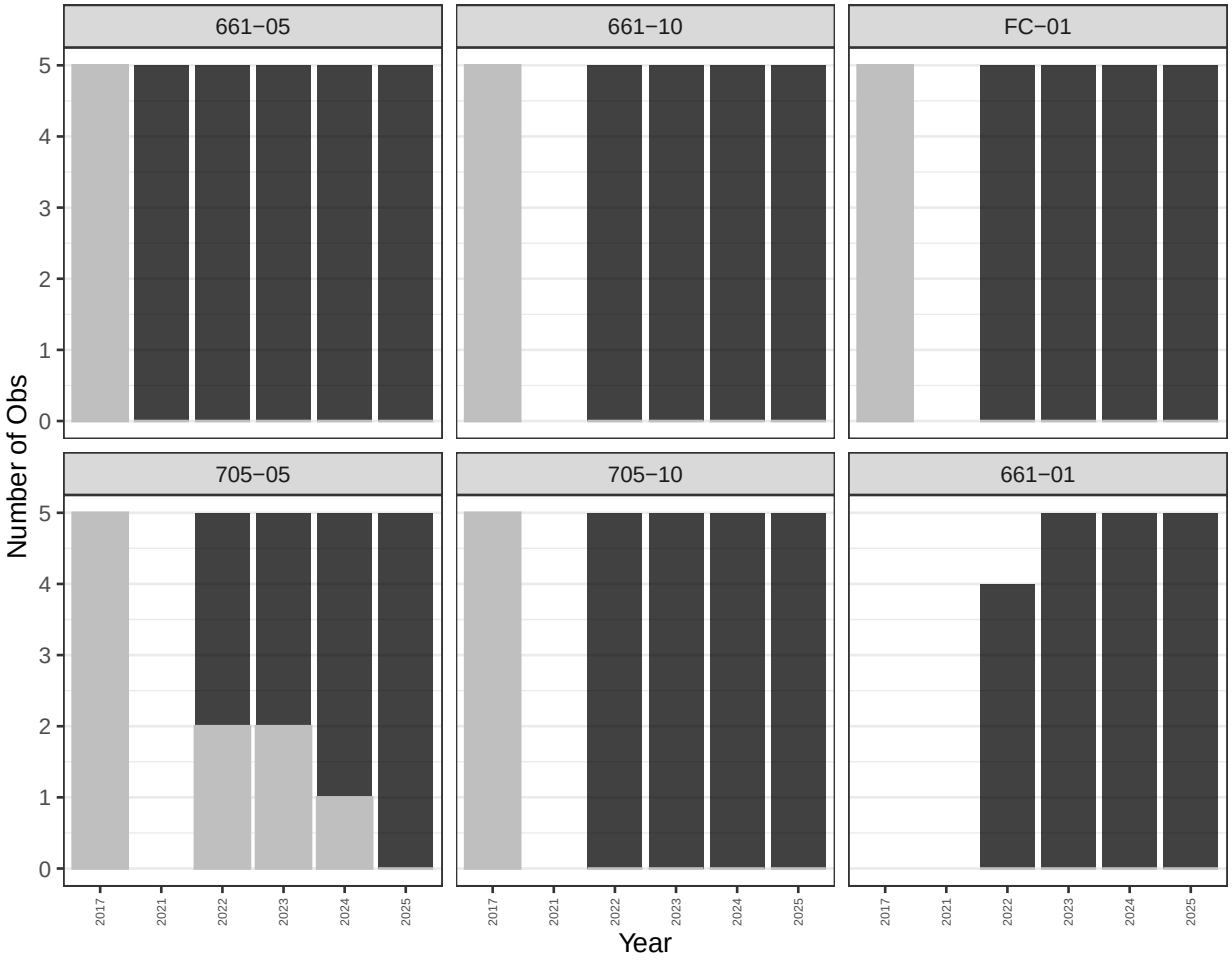
Final Summary Table

Variable	Selenium
Watershed	Davidson Creek
Waterbody	Stream
Streams Removed	661-05, 661-10, 661-01
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

2 Creek 661

2.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

Watershed	Site	Year	Class	Period	#Obs Removed
Creek 661	661-05	2017	monit	before	5
Creek 661	661-10	2017	monit	before	5
Creek 661	FC-01	2017	control	before	5
Creek 661	705-05	2017	control	before	5
Creek 661	705-10	2017	control	before	5

2.2 Sample Sizes for Modelling

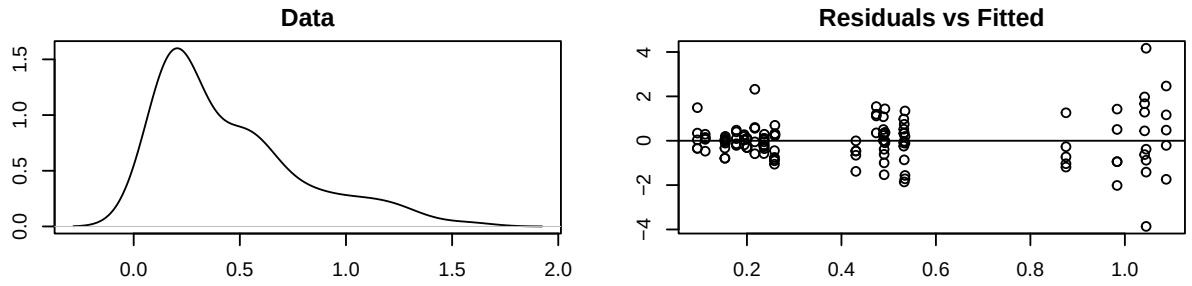
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Creek 661	661-05	before	15	0.9600	0
Creek 661	661-05	after	10	1.0275	0
Creek 661	661-10	before	10	0.4600	0
Creek 661	661-10	after	10	0.5300	0
Creek 661	FC-01	before	10	0.1600	0
Creek 661	FC-01	after	10	0.2925	0
Creek 661	705-05	before	10	0.1050	40
Creek 661	705-05	after	10	0.1450	10
Creek 661	705-10	before	10	0.2050	0
Creek 661	705-10	after	10	0.2150	0
Creek 661	661-01	before	9	0.6000	0
Creek 661	661-01	after	10	0.4300	0

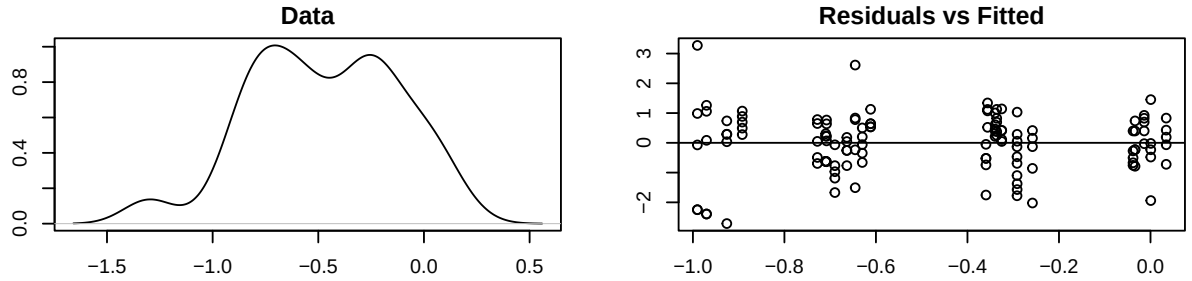
2.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-05	2024	9	impact	after	1.59	1.045	4.169	Y
Creek 661	661-05	2024	9	impact	after	0.54	1.045	-3.862	Y

Outliers on log scale:

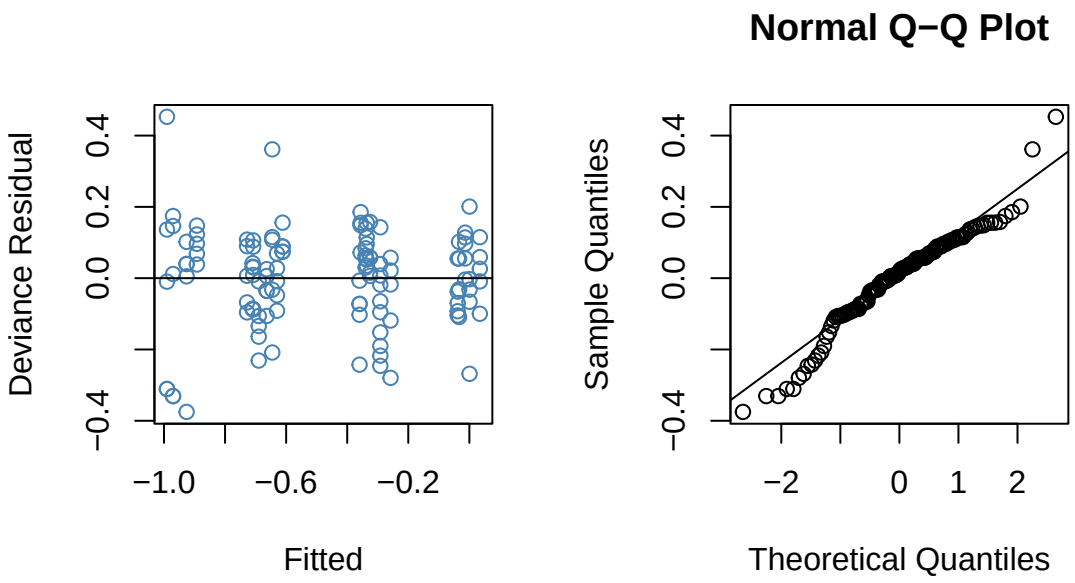
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	705-05	2022	9	control	before	-0.5376	-0.9903	3.273	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

2.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.090676	0.090676	1	3.996	4.7418	0.0951	
period	0.051157	0.051157	1	2.504	2.6752	0.2180	
class:period	0.006206	0.006206	1	115.958	0.3245	0.5700	0.644

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
124	0.6492	100%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-05, 661-10) and control sites (661-01, FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

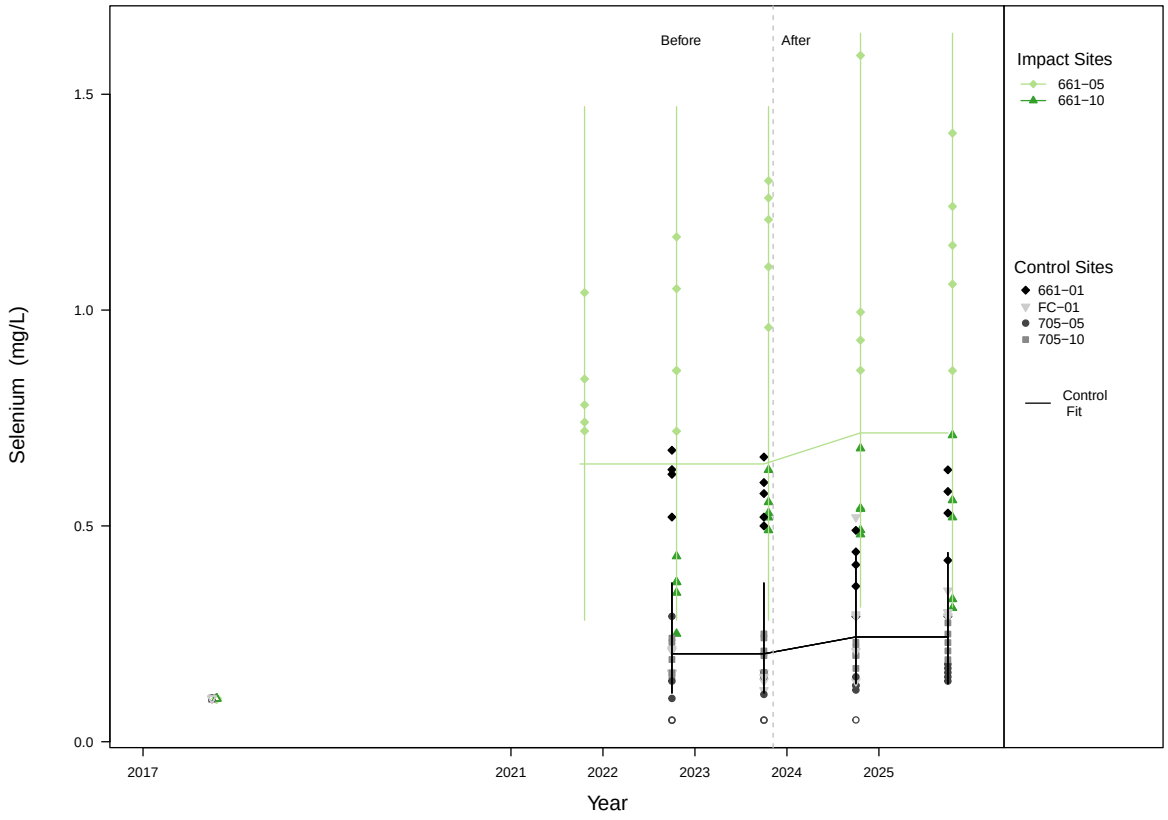
Impact vs.	Estimate	Significance
control sites	-0.03	not significant

Conclusion:

The change in Selenium concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.644) different from the change at the control sites, according to the test on the BACI term (*class:period*).

2.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of

data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

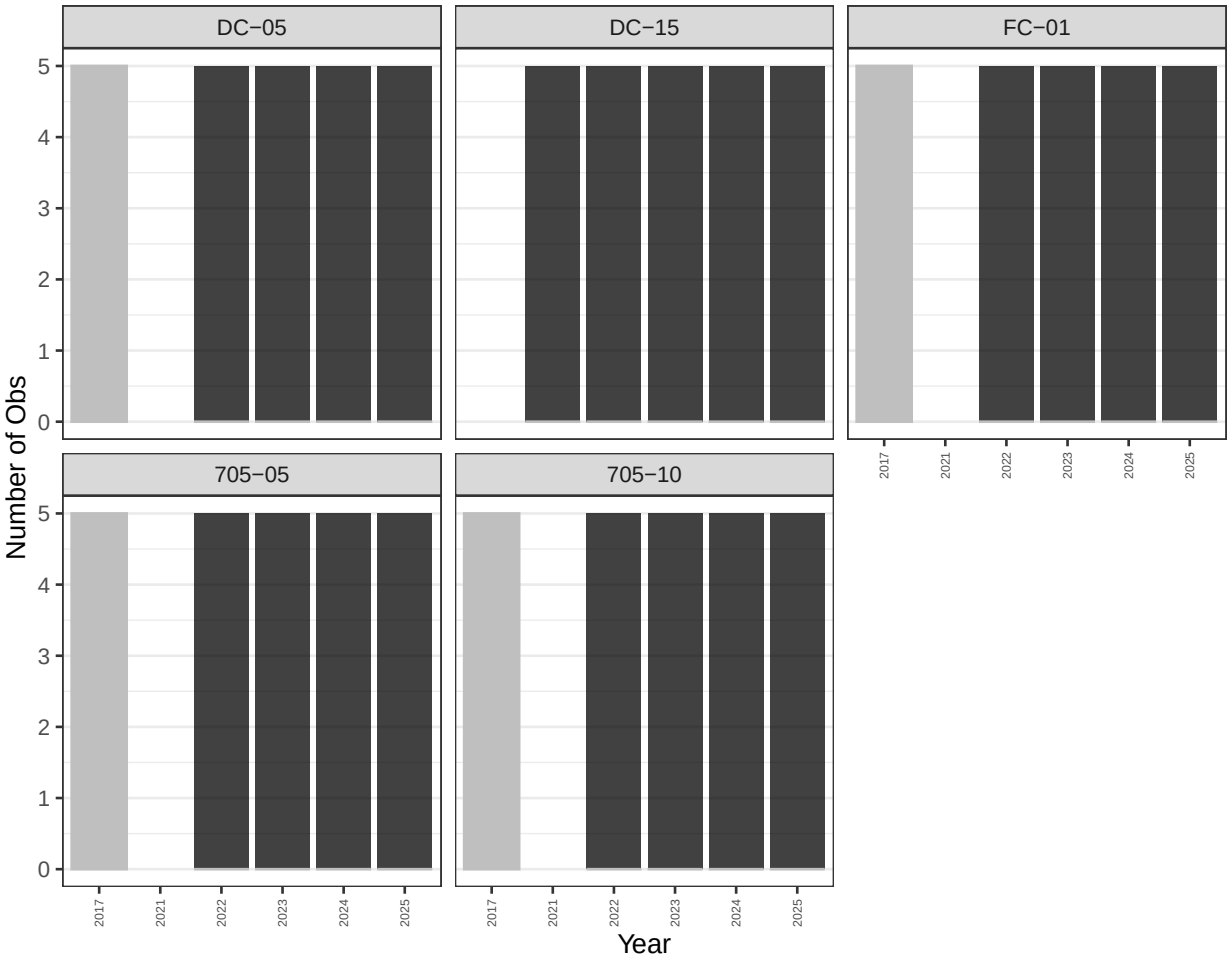
Variable	Selenium
Watershed	Creek 661
Waterbody	Stream
Streams Removed	DC-05, DC-15
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

B-4.1.12 Silver

1 Davidson Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

Watershed	Site	Year	Class	Period	#Obs Removed
Davidson Creek	DC-05	2017	monit	before	5
Davidson Creek	FC-01	2017	control	before	5
Davidson Creek	705-05	2017	control	before	5
Davidson Creek	705-10	2017	control	before	5

1.2 Sample Sizes for Modelling

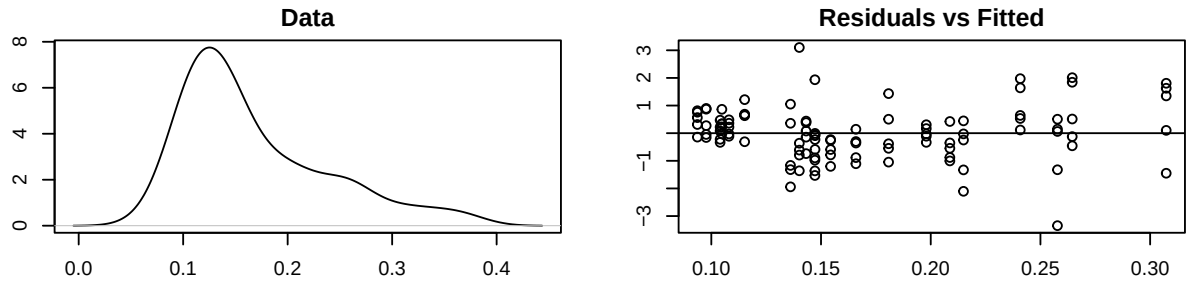
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Davidson Creek	DC-05	before	10	0.2345	0
Davidson Creek	DC-05	after	10	0.2695	0
Davidson Creek	DC-15	before	15	0.1710	0
Davidson Creek	DC-15	after	10	0.2395	0
Davidson Creek	FC-01	before	10	0.1170	0
Davidson Creek	FC-01	after	10	0.1098	0
Davidson Creek	705-05	before	10	0.1015	0
Davidson Creek	705-05	after	10	0.1220	0
Davidson Creek	705-10	before	10	0.1395	0
Davidson Creek	705-10	after	10	0.1215	0

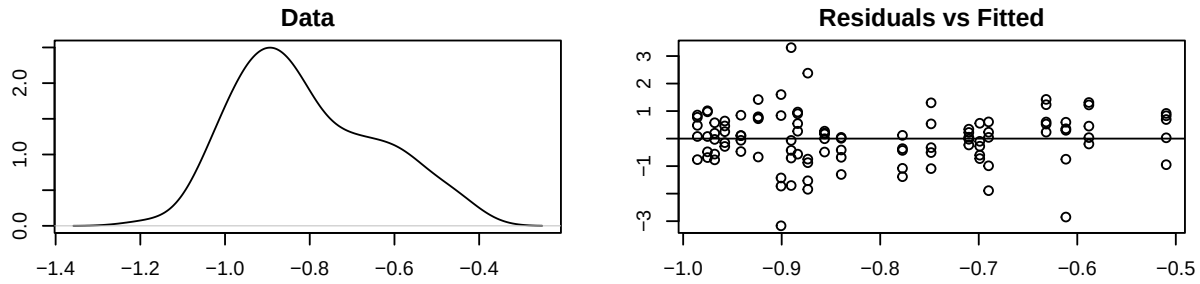
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	DC-05	2024	9	impact	after	0.137	0.2578	-3.347	Y
Davidson Creek	FC-01	2023	9	control	before	0.252	0.1401	3.101	Y

Outliers on log scale:

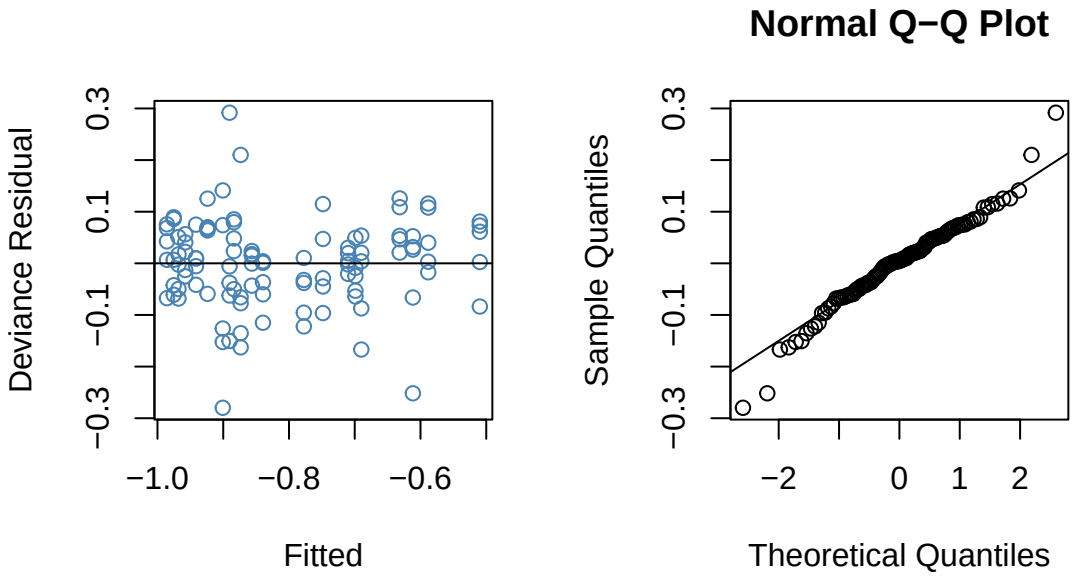
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	FC-01	2023	9	control	before	-0.5986	-0.8904	3.305	Y
Davidson Creek	705-05	2023	9	control	before	-1.1805	-0.9007	-3.169	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.312954	0.312954	1	2.991	40.1425	0.0080	
period	0.007682	0.007682	1	2.754	0.9854	0.4000	
class:period	0.066211	0.066211	1	97.217	8.4928	0.0044	0.0132

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
105	1.417	100%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

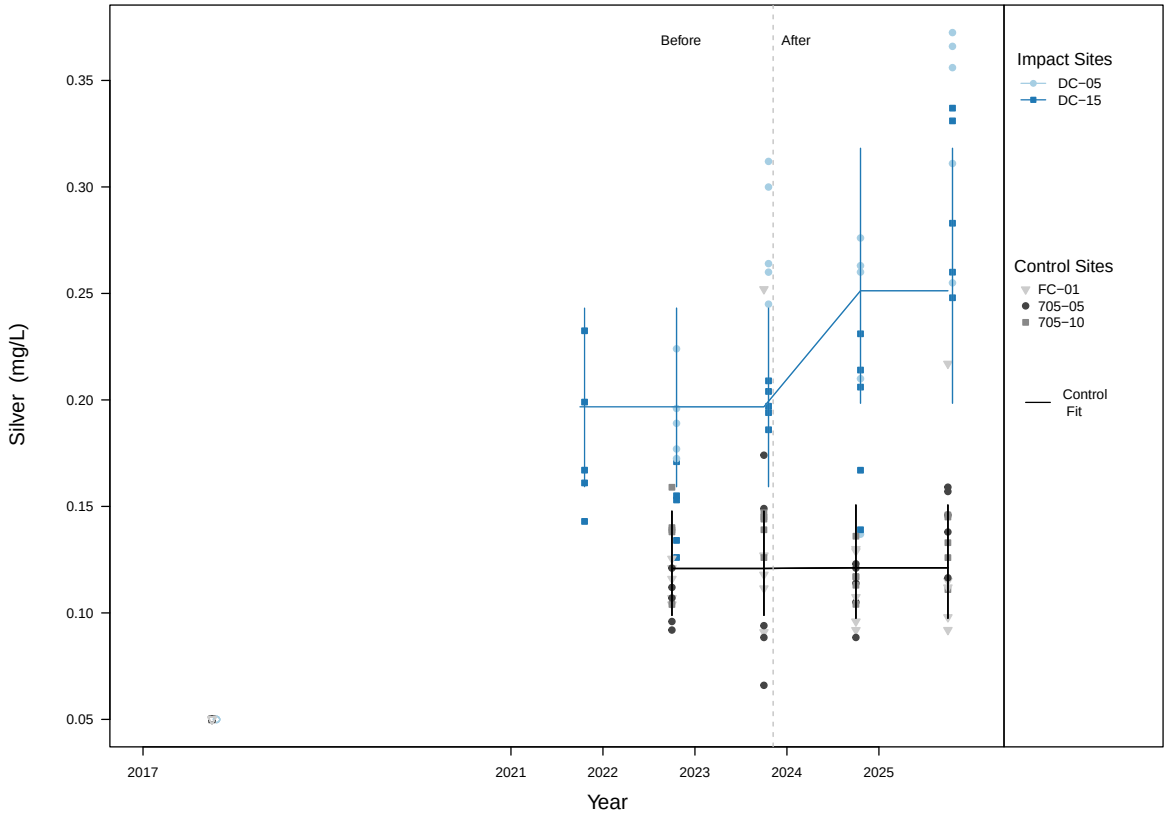
Impact vs.	Estimate	Significance
control sites	0.105	significant

Conclusion:

The change in Silver concentrations at the impact sites from *before* to *after* was significantly (*adjusted p* = 0.0132) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

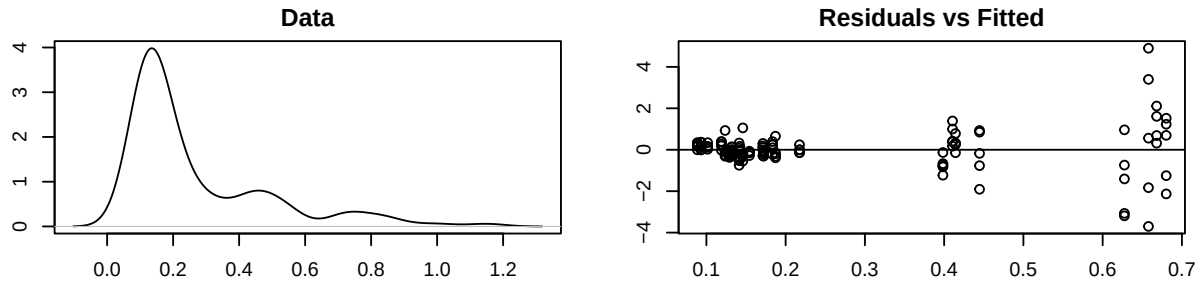
Creek 661	661-01	after	10	0.5195	0

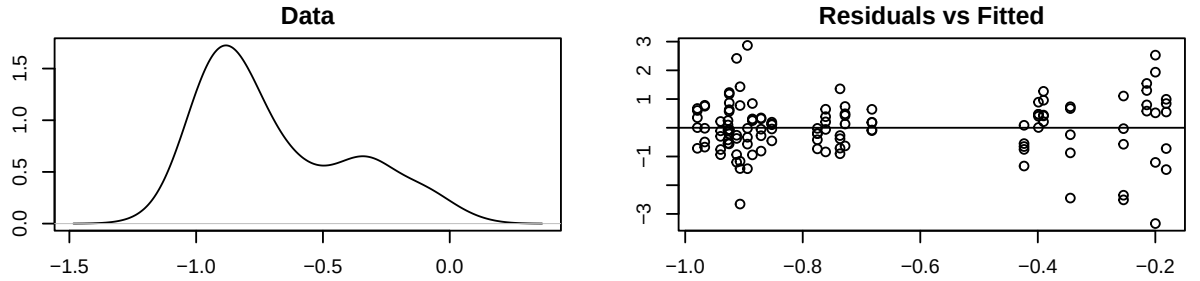
2.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-01	2025	9	control	after	1.150	0.6578	4.898	Y
Creek 661	661-01	2025	9	control	after	0.286	0.6578	-3.700	Y
Creek 661	661-01	2025	9	control	after	0.999	0.6578	3.395	Y
Creek 661	661-01	2024	9	control	after	0.307	0.6275	-3.189	Y
Creek 661	661-01	2024	9	control	after	0.319	0.6275	-3.070	Y

Outliers on log scale:

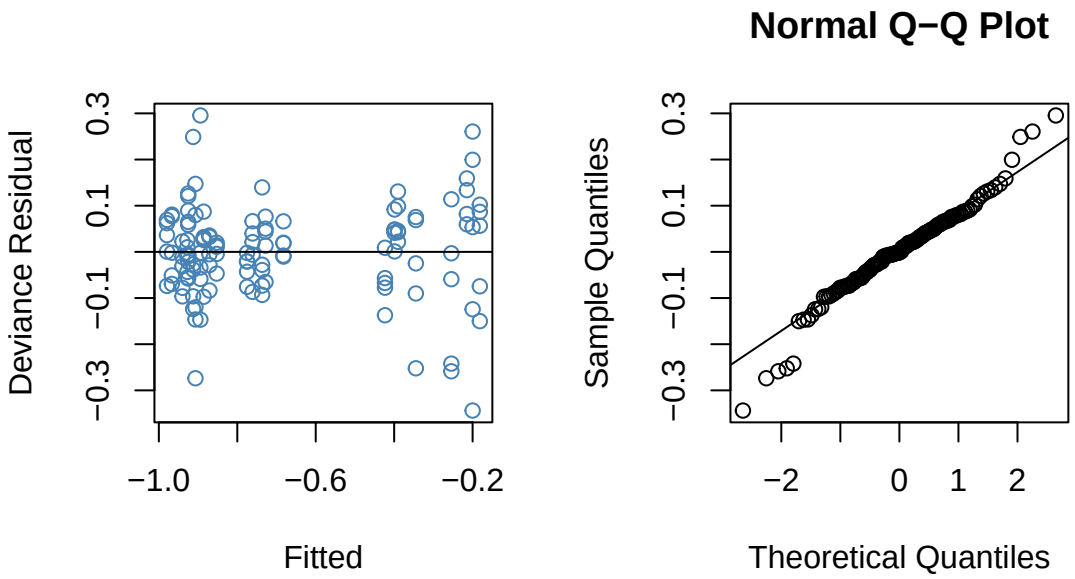
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-01	2025	9	control	after	-0.5436	-0.1999	-3.336	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

2.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.004310	0.004310	1	3.999	0.4059	0.559	
period	0.001162	0.001162	1	2.571	0.1095	0.766	
class:period	0.027747	0.027747	1	115.964	2.6133	0.109	0.202

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
124	0.0645	8%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-05, 661-10) and control sites (661-01, FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

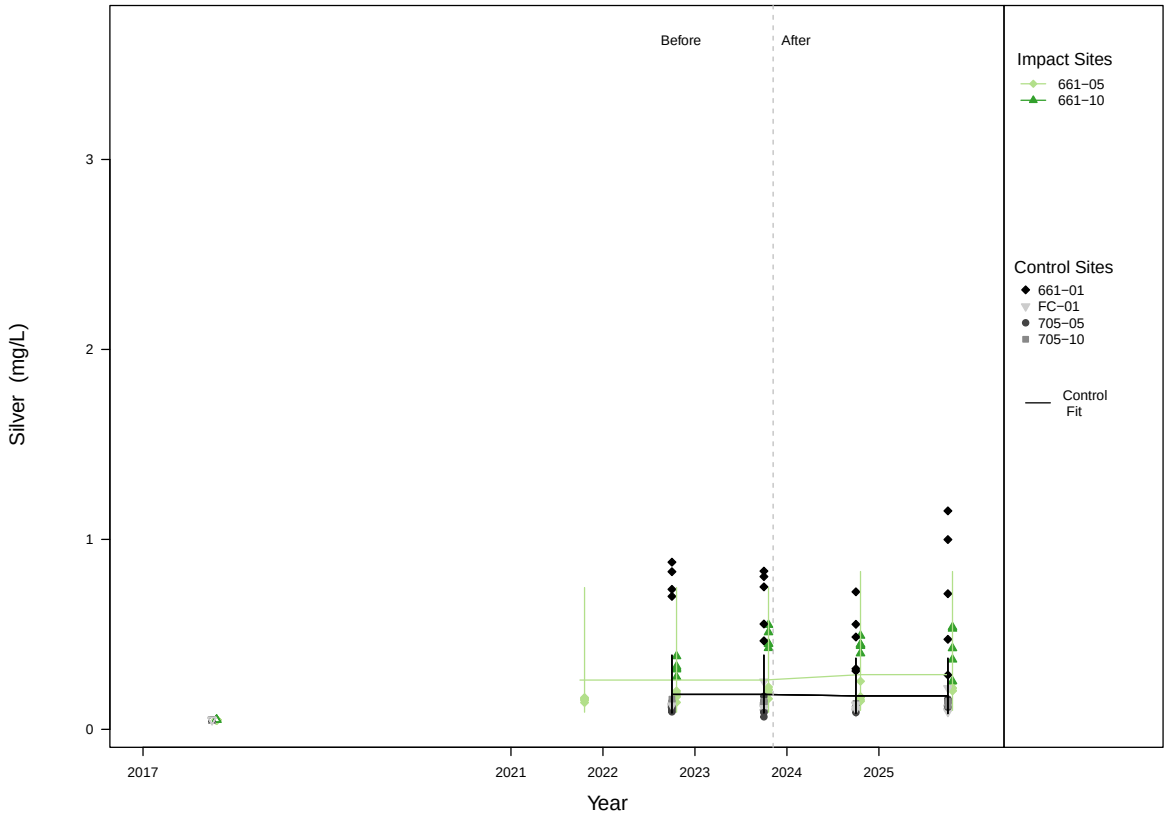
Impact vs.	Estimate	Significance
control sites	0.0641	not significant

Conclusion:

The change in Silver concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p* = 0.202) different from the change at the control sites, according to the test on the BACI term (*class:period*).

2.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of

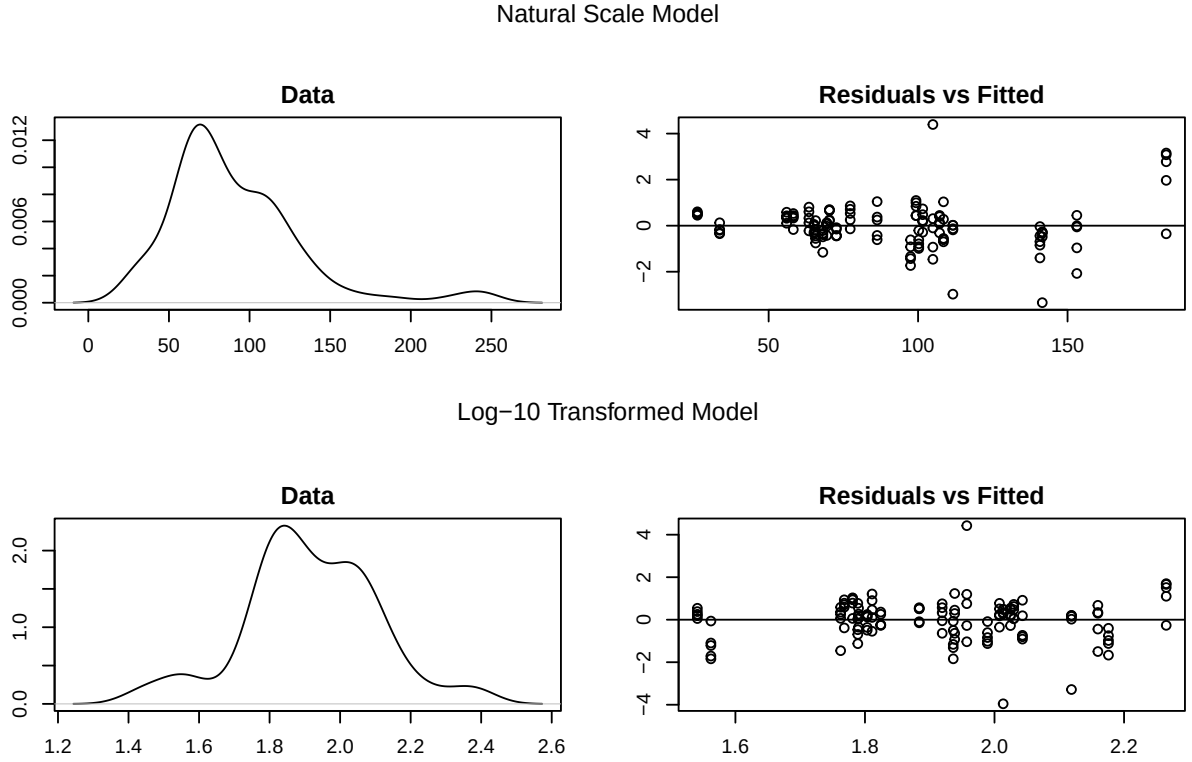
Davidson Creek	705-10	before	15	59.80	0
Davidson Creek	705-10	after	10	66.05	0

1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	705-05	2025	9	control	after	192.0	104.9	4.394	Y
Davidson Creek	DC-05	2024	9	impact	after	75.3	141.5	-3.344	Y
Davidson Creek	DC-05	2025	9	impact	after	245.5	183.0	3.155	Y
Davidson Creek	DC-05	2025	9	impact	after	244.0	183.0	3.079	Y

Outliers on log scale:

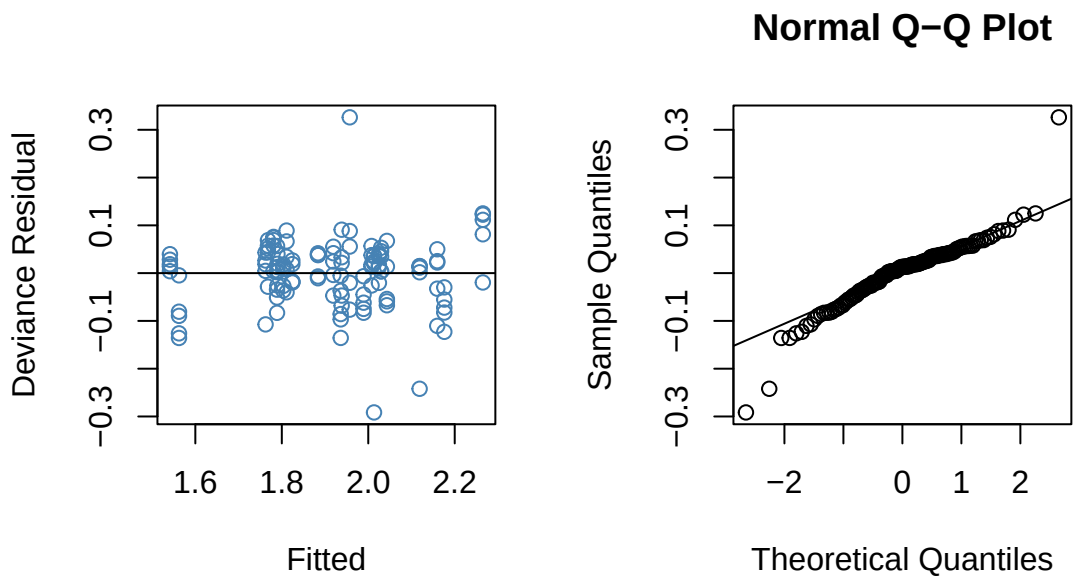
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	705-05	2025	9	control	after	2.283	1.957	4.425	Y
Davidson Creek	DC-15	2024	9	impact	after	1.722	2.013	-3.956	Y
Davidson Creek	DC-05	2024	9	impact	after	1.877	2.119	-3.284	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.008493	0.008493	1	3.005	1.564	0.3	
period	0.015007	0.015007	1	3.930	2.764	0.173	
class:period	0.078117	0.078117	1	114.853	14.386	<0.001	0.00207

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
125	0.3307	88%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

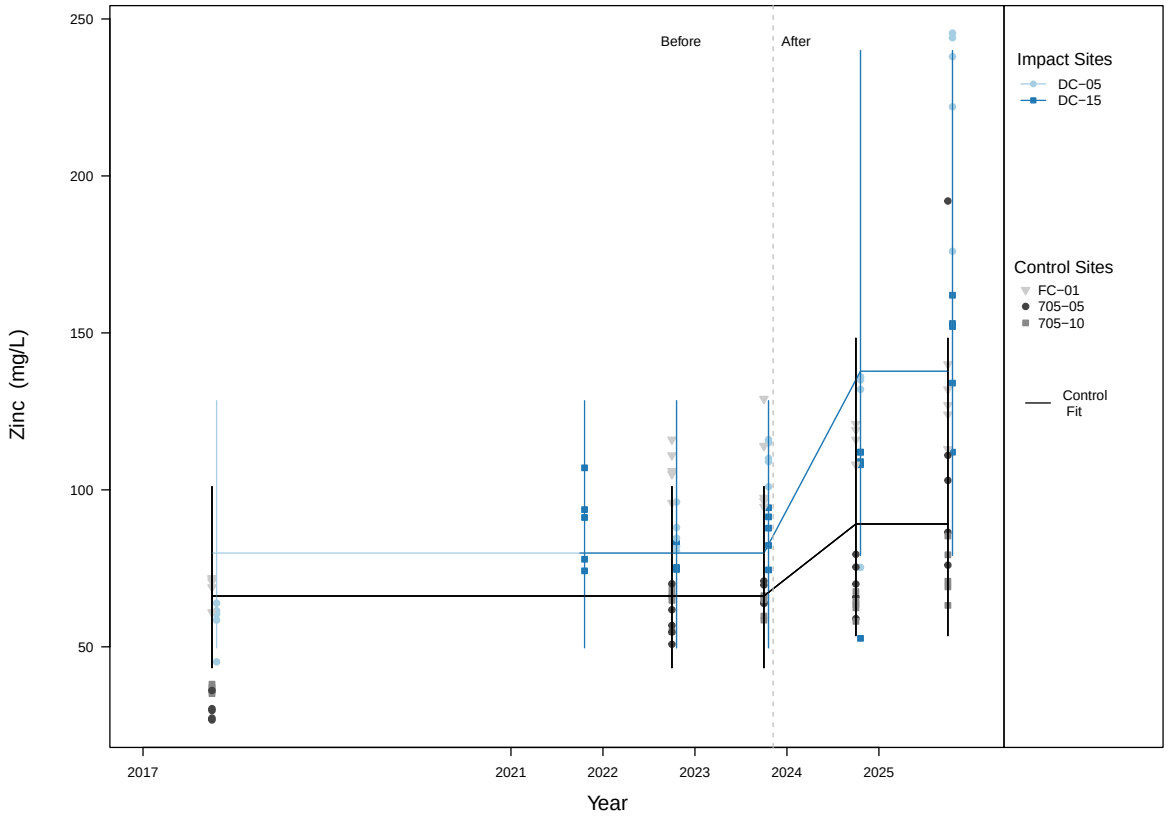
Impact vs.	Estimate	Significance
control sites	0.1076	significant

Conclusion:

The change in Zinc concentrations at the impact sites from *before* to *after* was significantly (*adjusted p* = 0.0021) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

APPENDIX B-5A: 2025 SEDIMENT QUALITY COMPARISON TO THE BASELINE 95TH PERCENTILES AT DC-05

Parameter	Baseline (2017, 2022, and 2023)		2025	
	N	95th Percentile	N	Mean
Clay (<4 µm; %)	15	3.1	5	4.7
Silt (63 µm–4 µm; %)	15	20.71	5	10.4
Sand (2 mm–63 µm; %)	15	88.4	5	71.9
Gravel (>2 mm; %)	15	80.77	5	13.1
Total Organic Carbon (%)	15	6.47	5	5.6
Arsenic	15	16.75	5	23.8
Cadmium	15	0.8515	5	1.16
Chromium	15	32.73	5	40.4
Copper	15	14.23	5	23.7
Iron	15	24090	5	26250
Lead	15	13.69	5	23.1
Manganese	15	1600	5	1439
Mercury	15	0.08917	5	0.0770
Molybdenum	15	1.915	5	3.14
Nickel	15	17.58	5	26.4
Selenium	15	1.103	5	0.66
Silver	15	0.3036	5	0.332
Zinc	15	115.3	5	225

Notes:
Concentrations in mg/kg unless otherwise noted.

Shaded cells indicate 2025 mean concentration greater than 95th percentile baseline concentration.

Values below detection limit were replaced with half the detection limit for calculations.

APPENDIX B-5B: 2025 SEDIMENT QUALITY COMPARISON TO THE BASELINE 95TH PERCENTILES AT DC-15

Parameter	Baseline (2021, 2022, and 2023)		2025	
	N	95th Percentile	N	Mean
Clay (<4 µm; %)	16	2.825	5	4.4
Silt (63 µm–4 µm; %)	16	14.8875	5	19.9
Sand (2 mm–63 µm; %)	16	90.65	5	54.1
Gravel (>2 mm; %)	16	42.2	5	21.7
Total Organic Carbon (%)	16	4.425	5	7.9
Arsenic	16	13.725	5	18.6
Cadmium	16	0.5265	5	0.765
Chromium	16	55.9	5	29.3
Copper	16	25.675	5	20.0
Iron	16	27500	5	25160
Lead	16	17.65	5	15.7
Manganese	16	1652.5	5	1538
Mercury	16	0.079775	5	0.0888
Molybdenum	16	4.04	5	1.56
Nickel	16	32.95	5	19.3
Selenium	16	0.725	5	0.81
Silver	16	0.22225	5	0.292
Zinc	16	99.875	5	143

Notes:
Concentrations in mg/kg unless otherwise noted.

Shaded cells indicate 2025 mean concentration greater than 95th percentile baseline concentration.

Values below detection limit were replaced with half the detection limit for calculations.

APPENDIX B-5C: 2025 SEDIMENT QUALITY COMPARISON TO THE BASELINE 95TH PERCENTILES AT 661-05

Parameter	Baseline (2017, 2021, 2022, and 2023)		2025	
	N	95th Percentile	N	Mean
Clay (<4 µm; %)	20	3.555	5	1.4
Silt (63 µm–4 µm; %)	20	23.3825	5	7.92
Sand (2 mm–63 µm; %)	20	87.6	5	81.8
Gravel (>2 mm; %)	20	61.54	5	8.88
Total Organic Carbon (%)	20	7.46625	5	6.10
Arsenic	20	17.01	5	14.3
Cadmium	20	0.43115	5	0.549
Chromium	20	88.505	5	57.1
Copper	20	14.06	5	12.6
Iron	20	18705	5	16830
Lead	20	14.555	5	12.8
Manganese	20	2541	5	1558
Mercury	20	0.09411	5	0.0954
Molybdenum	20	6.7925	5	3.37
Nickel	20	45.52	5	22.2
Selenium	20	1.262	5	1.14
Silver	20	0.21065	5	0.217
Zinc	20	83.2	5	126

Notes:
Concentrations in mg/kg unless otherwise noted.

Shaded cells indicate 2025 mean concentration greater than 95th percentile baseline concentration.

Values below detection limit were replaced with half the detection limit for calculations.

APPENDIX B-5D: 2025 SEDIMENT QUALITY COMPARISON TO THE BASELINE 95TH PERCENTILES AT 661-10

Parameter	Baseline (2017, 2022, and 2023)		2025	
	N	95th Percentile	N	Mean
Clay (<4 µm; %)	15	1.6	5	1.4
Silt (63 µm–4 µm; %)	15	6.095	5	5.68
Sand (2 mm–63 µm; %)	15	94.76	5	81.7
Gravel (>2 mm; %)	15	80.73	5	11.3
Total Organic Carbon (%)	15	6.242	5	5.0
Arsenic	15	15.73	5	23.7
Cadmium	15	1.482	5	1.57
Chromium	15	35.79	5	74.0
Copper	15	14.44	5	16.4
Iron	15	21190	5	23650
Lead	15	21.13	5	18.5
Manganese	15	1207	5	2002
Mercury	15	0.07992	5	0.0754
Molybdenum	15	1.074	5	6.11
Nickel	15	15.46	5	40.4
Selenium	15	0.5775	5	0.486
Silver	15	0.5227	5	0.423
Zinc	15	330.6	5	357

Notes:
Concentrations in mg/kg unless otherwise noted.

Shaded cells indicate 2025 mean concentration greater than 95th percentile baseline concentration.

Values below detection limit were replaced with half the detection limit for calculations.

Appendix B-7 2025 Stream Sediment Hydrocarbon Special Study Quality Assurance and Quality Control Results, Blackwater Mine

Appendix B-7: 2025 Stream Sediment Hydrocarbon Special Study Quality Assurance and Quality Control Results, Blackwater Mine

In part of the hydrocarbon special study, 39 sediment samples, including 4 field split duplicates, were collected for analysis of moisture and Polycyclic Aromatic Hydrocarbon (PAH) parameters. Certificates of Analysis, including complete results from laboratory quality assurance and quality control (QA/QC) checks, can be made available on request.

All analyses were executed within the required hold times (BC ENV 2023).

Laboratory method detection limits were aligned with published BC detection limit standards (BC ENV 2023).

All laboratory quality control results for completed matrix spikes, method blanks, laboratory control samples, and laboratory duplicates met the laboratories data quality objectives.

PAH surrogate compounds were tested as per guidance in the *British Columbia Environmental Laboratory Manual* (BC ENV 2023). All surrogate sample recoveries were between the BC data quality objective of 50 to 140% (Table B7-1). One surrogate laboratory duplicate result marginally exceeded (137%) the relative percent difference data quality objective (130%) for chrysene-d12 in TC-05 Rep A (VA25C4828-001) however as indicated by the laboratory, surrogates are less important for QC samples than for test samples. The non-surrogate compound for chrysene-d12, chrysene, met all as data quality objectives, including in sample TC-05 Rep A.

Four field split (duplicate) sediment samples were collected (Appendix B-6). As all the PAH parameter results were less than the method detection limit, relative percent difference (RPD) was calculated for moisture results only. All RPD calculations (n =4) were equal to or less than 2 (Table B7-2).

Overall, the field and laboratory QA/QC results demonstrated that the data quality objectives were met and results indicated that sediment quality data collected in part of the 2025 stream sediment hydrocarbon special study were reliable and of good quality.

Notes:
ND = surrogate recovery could not be measured due to sample matrix interference; QA/QC = Quality Assurance / Quality Control
Units are percent recovery.

TABLE B7-2 RELATIVE PERCENT DIFFERENCE FOR STREAM SEDIMENT SPECIAL STUDY SPLIT SAMPLES, BLACKWATER MINE, 2025

Sample:	DC-05 Rep A				661-05 Rep A			
Date:	15-Sep-2025				11-Sep-2025			
Parameter	Primary Result	Split Result	Detection Limit	Relative Percent Difference	Primary Result	Split Result	Detection Limit	Relative Percent Difference
Moisture (%)	77.8	77.1	0.25	0.90	42.0	41.4	0.25	1.44

Sample:	661-10 Rep-A				705-05 Rep A			
Date:	13-Sep-2025				10-Sep-2025			
Parameter	Primary Result	Split Result	Detection Limit	Relative Percent Difference	Primary Result	Split Result	Detection Limit	Relative Percent Difference
Moisture (%)	30.3	29.7	0.25	2.0	25.4	25.8	0.25	1.56

Note:
All Polycyclic Aromatic Hydrocarbons results were less than the detection limit.

Appendix C-3 2025 Periphyton Laboratory Analyses Quality Assurance and Quality Control, Blackwater Mine

Appendix C-3: 2025 Periphyton Laboratory Analyses Quality Assurance and Quality Control, Blackwater Mine

Five replicate periphyton biomass samples per site were submitted for chlorophyll *a* analysis. Certificate of Analysis, including complete results from laboratory quality assurance and quality control (QA/QC) checks, can be made available on request. Chlorophyll *a* analyses were completed within the required hold time (BC ENV 2023), and all method blanks and laboratory control samples met the laboratory's data quality objectives.

Three replicate periphyton taxonomy samples per site were submitted for taxonomic analysis. Three taxonomy samples were included in quality control counts across two taxonomists. The taxonomy percent similarities between taxonomists ranged from 78.91% to 90.41% (Table C3-1). The laboratory's minimum taxonomist recount acceptance standard is 80%. The sample from DC-05 had the percent similarity that did not exceed the laboratory's minimum standard. The largest dissimilarities across all QA/QC samples were in the unit counts for colony-forming taxa (e.g., *Chamaesiphon* sp. and *Encyonema* sp.). Biologica defines a counting unit as "a colony, filament, or a single cell". A colony or filament is not defined by number of cells within them and it is possible that filaments or colonies of different sizes were enumerated. When 80% similarity is not met, the reasons for the discrepancies between analysts are discussed and necessary adjustments made to the dataset. No adjustments were required for the 2025 dataset.

Based on the laboratory QA/QC results, the periphyton data is considered reliable and of good quality.

Appendix C-5 Results of the 2025 Periphyton Biomass Before-After-Control-Impact Analysis

Contents

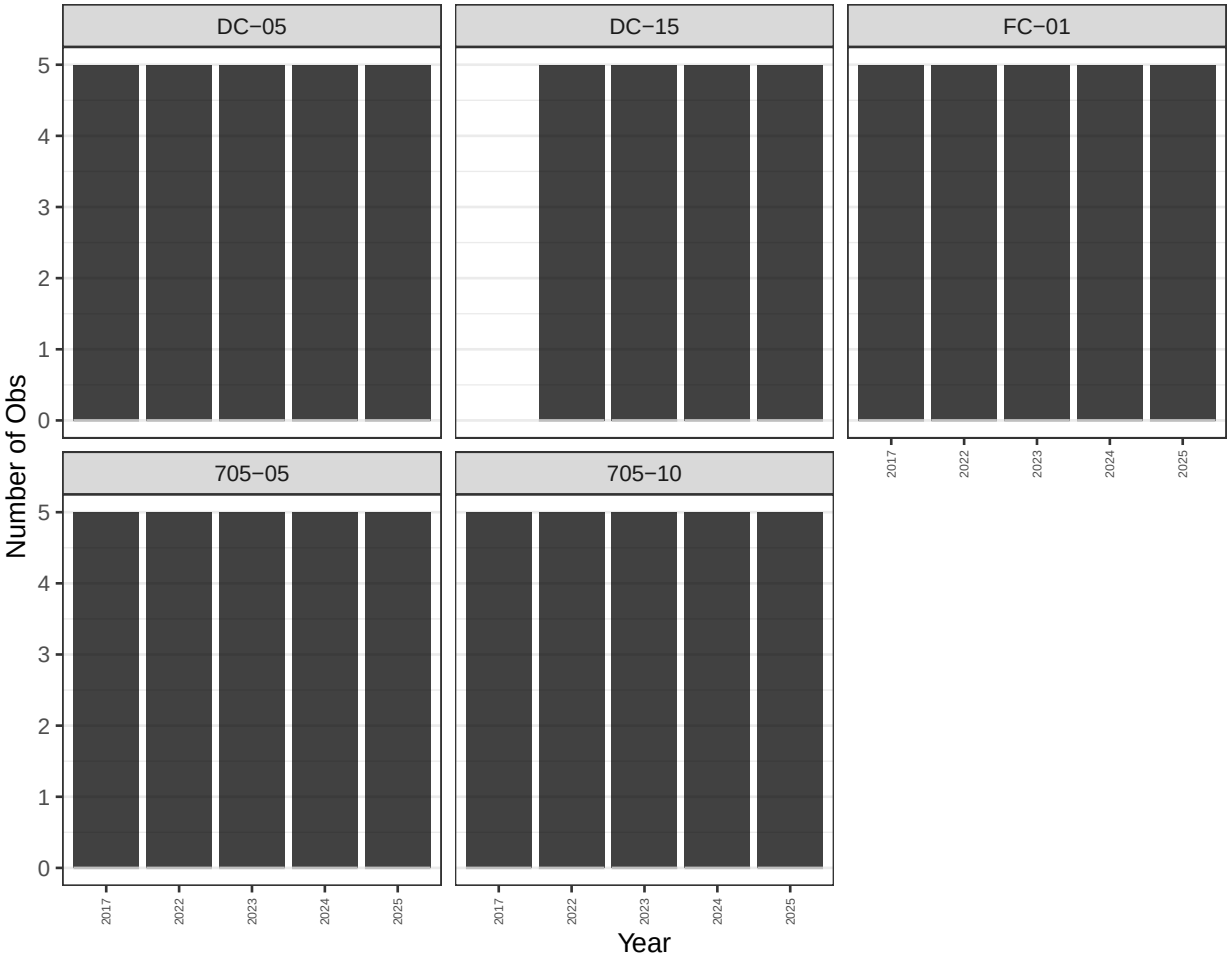
C-5 Periphyton Biomass **1**
C-5.1.1 Chlorophyll-a 1

Appendix C-5: 2025 Periphyton Biomass Before-After-Control-Impact Analysis

1 Davidson Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

1.2 Sample Sizes for Modelling

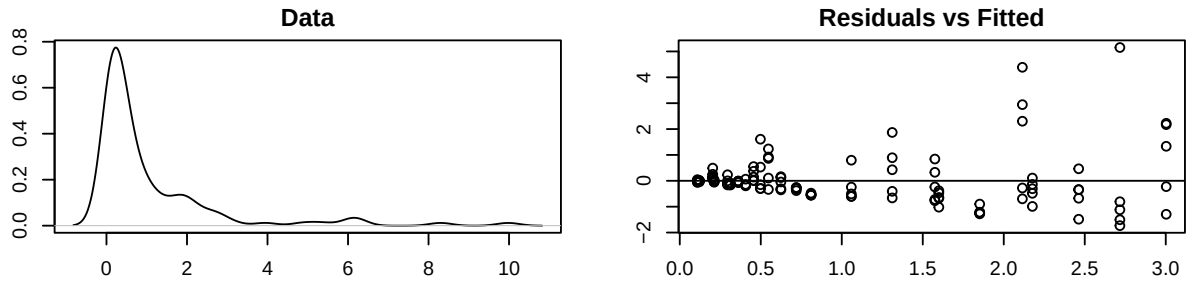
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Davidson Creek	DC-05	before	15	0.1595	0
Davidson Creek	DC-05	after	10	2.3364	0
Davidson Creek	DC-15	before	10	0.1347	0
Davidson Creek	DC-15	after	10	1.5355	0
Davidson Creek	FC-01	before	15	0.1900	0
Davidson Creek	FC-01	after	10	1.8805	0
Davidson Creek	705-05	before	15	0.4821	0
Davidson Creek	705-05	after	10	0.4805	0
Davidson Creek	705-10	before	15	0.1700	0
Davidson Creek	705-10	after	10	0.6700	0

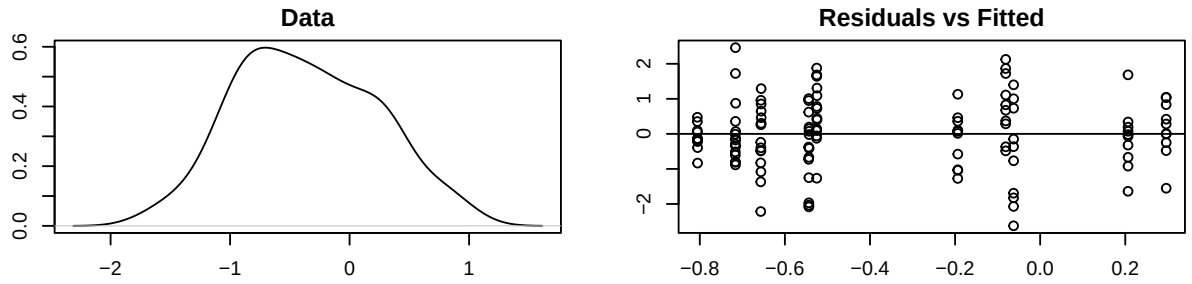
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	DC-15	2025	9	impact	after	9.980	2.717	5.152	Y
Davidson Creek	FC-01	2025	9	control	after	8.299	2.115	4.387	Y

Outliers on log scale:

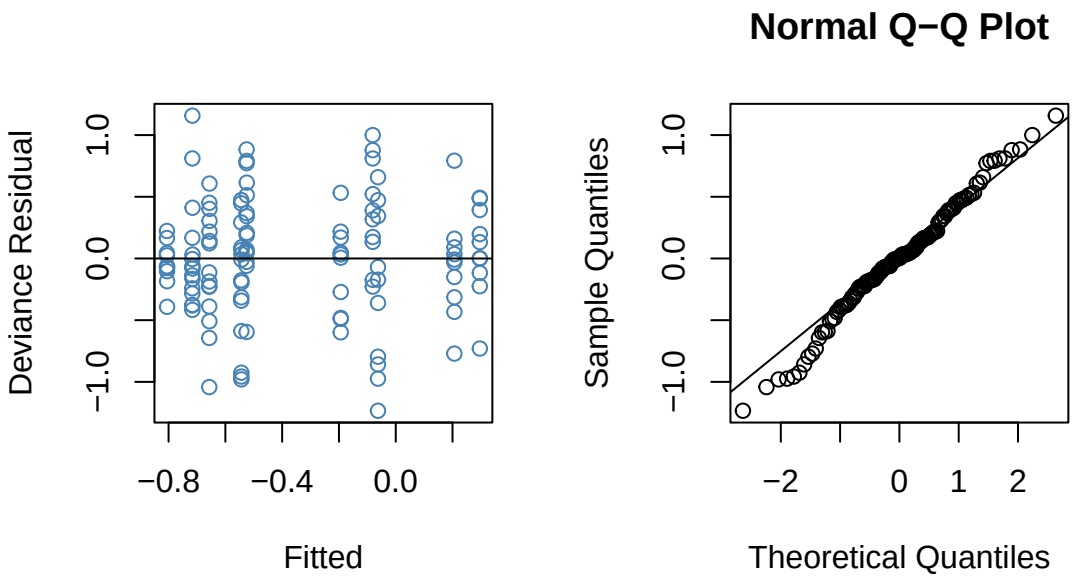
None

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.1094	0.1094	1	3.141	0.4945	0.5300	
period	14.6327	14.6327	1	3.164	66.1242	0.0032	
class:period	2.0393	2.0393	1	112.319	9.2156	0.0030	0.00298

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test

120	0.5615	100%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

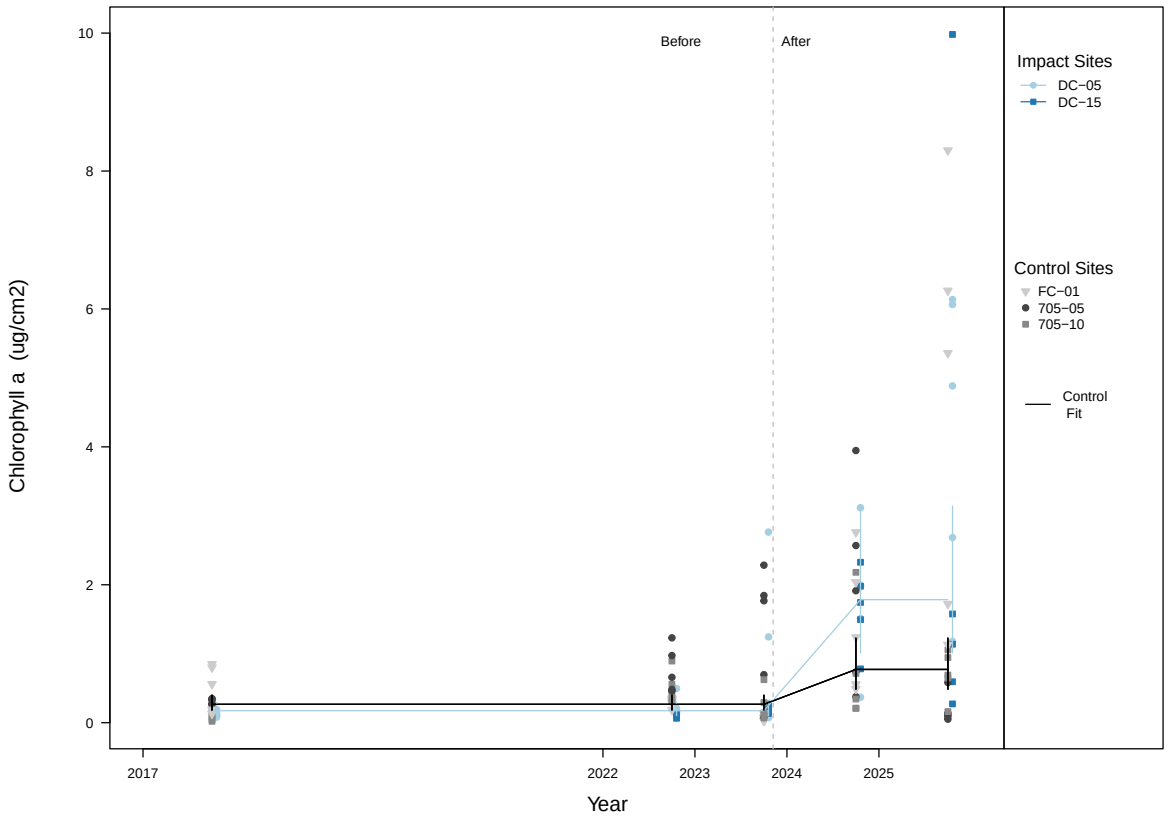
Impact vs.	Estimate	Significance
control sites	0.5496	significant

Conclusion:

The change in Chlorophyll a concentrations at the impact sites from *before* to *after* was significantly (*adjusted p =* 0.003) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

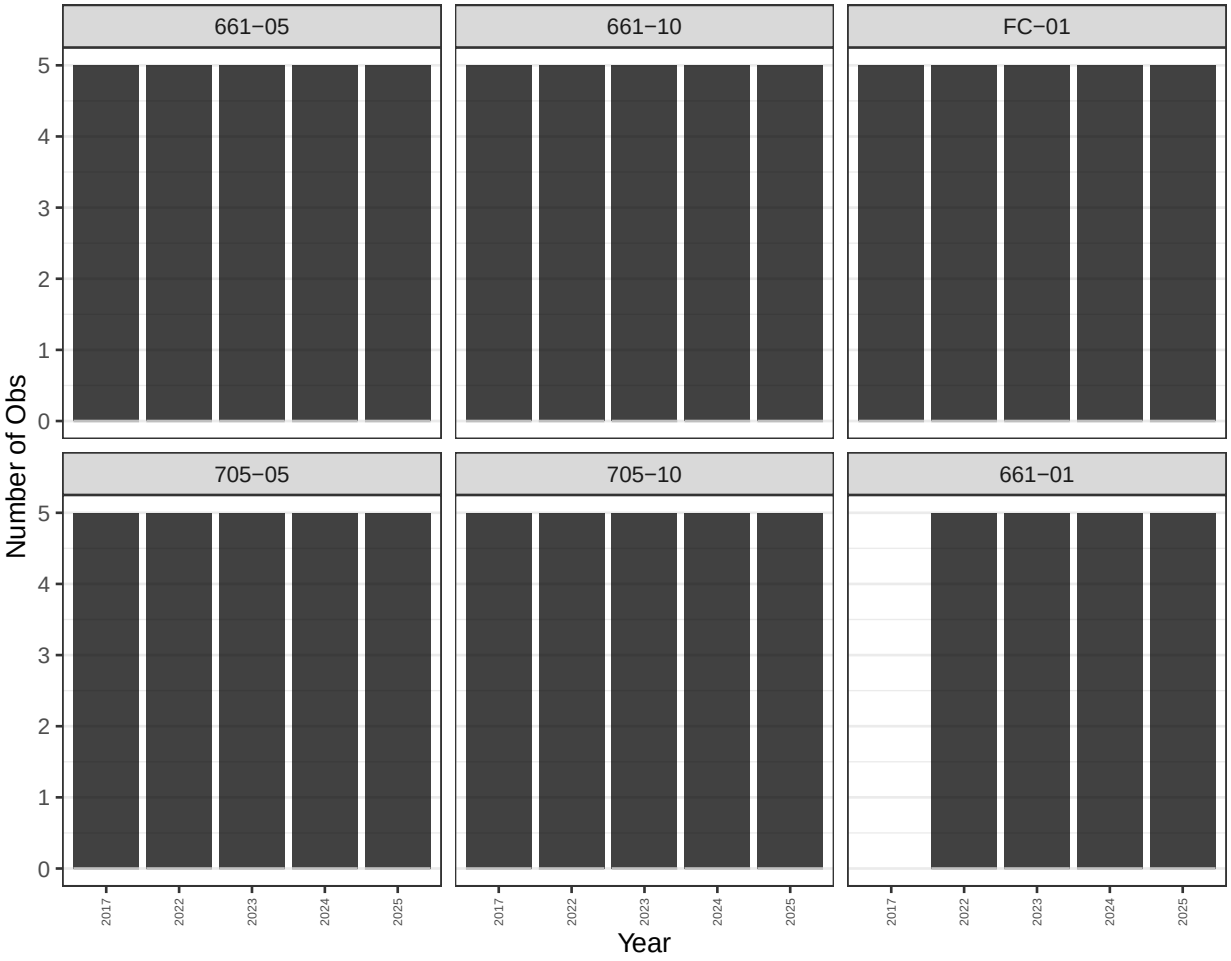
Final Summary Table

Variable	Chlorophyll a
Watershed	Davidson Creek
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	Yes

2 Creek 661

2.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

2.2 Sample Sizes for Modelling

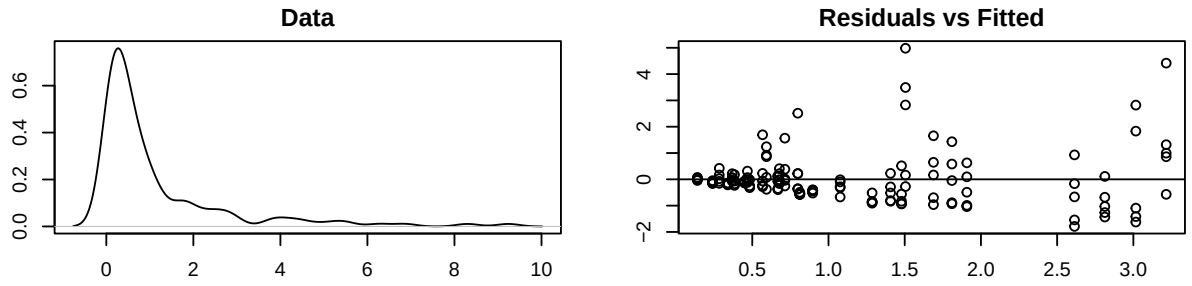
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Creek 661	661-05	before	15	0.1400	0
Creek 661	661-05	after	10	2.7006	0
Creek 661	661-10	before	15	0.2684	0
Creek 661	661-10	after	10	1.6132	0
Creek 661	FC-01	before	15	0.1900	0
Creek 661	FC-01	after	10	1.8805	0
Creek 661	705-05	before	15	0.4821	0
Creek 661	705-05	after	10	0.4805	0
Creek 661	705-10	before	15	0.1700	0
Creek 661	705-10	after	10	0.6700	0
Creek 661	661-01	before	10	0.9119	0
Creek 661	661-01	after	10	0.8567	0

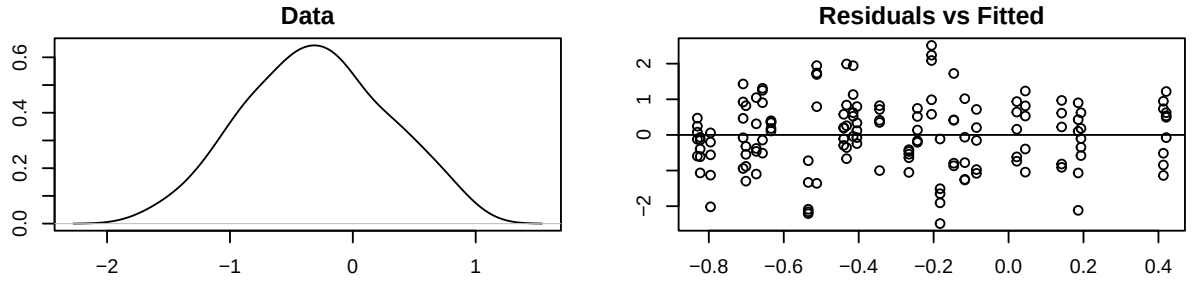
2.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	FC-01	2025	9	control	after	8.299	1.505	4.982	Y
Creek 661	661-05	2024	9	impact	after	9.238	3.215	4.416	Y
Creek 661	FC-01	2025	9	control	after	6.265	1.505	3.490	Y

Outliers on log scale:

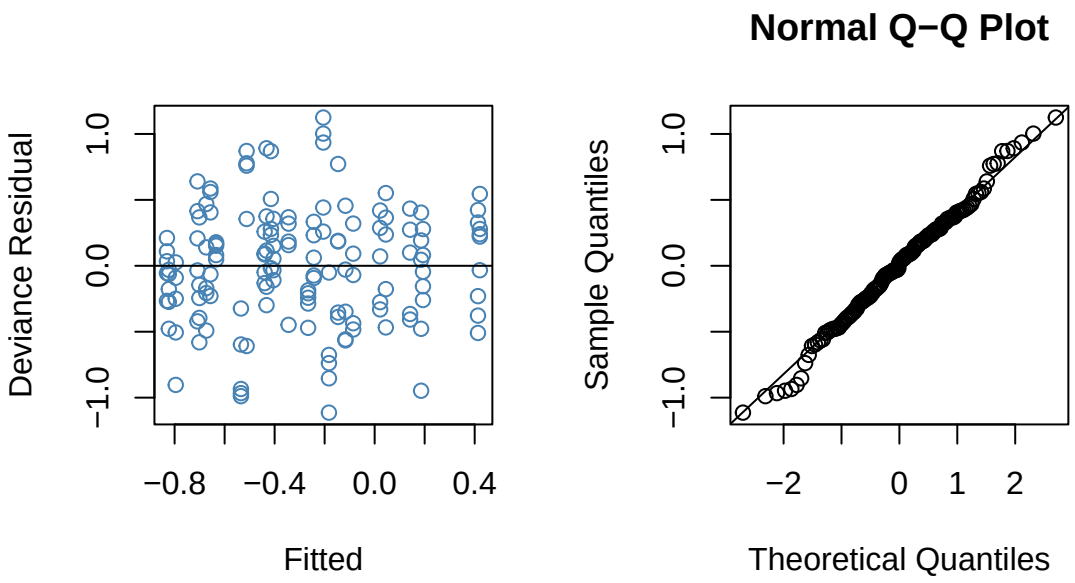
None

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

2.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.1492	0.1492	1	4.015	0.7446	0.437	
period	2.2512	2.2512	1	3.076	11.2331	0.0424	
class:period	2.5127	2.5127	1	134.401	12.5383	<0.001	0.0011

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
145	0.3998	99%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-05, 661-10) and control sites (661-01, FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

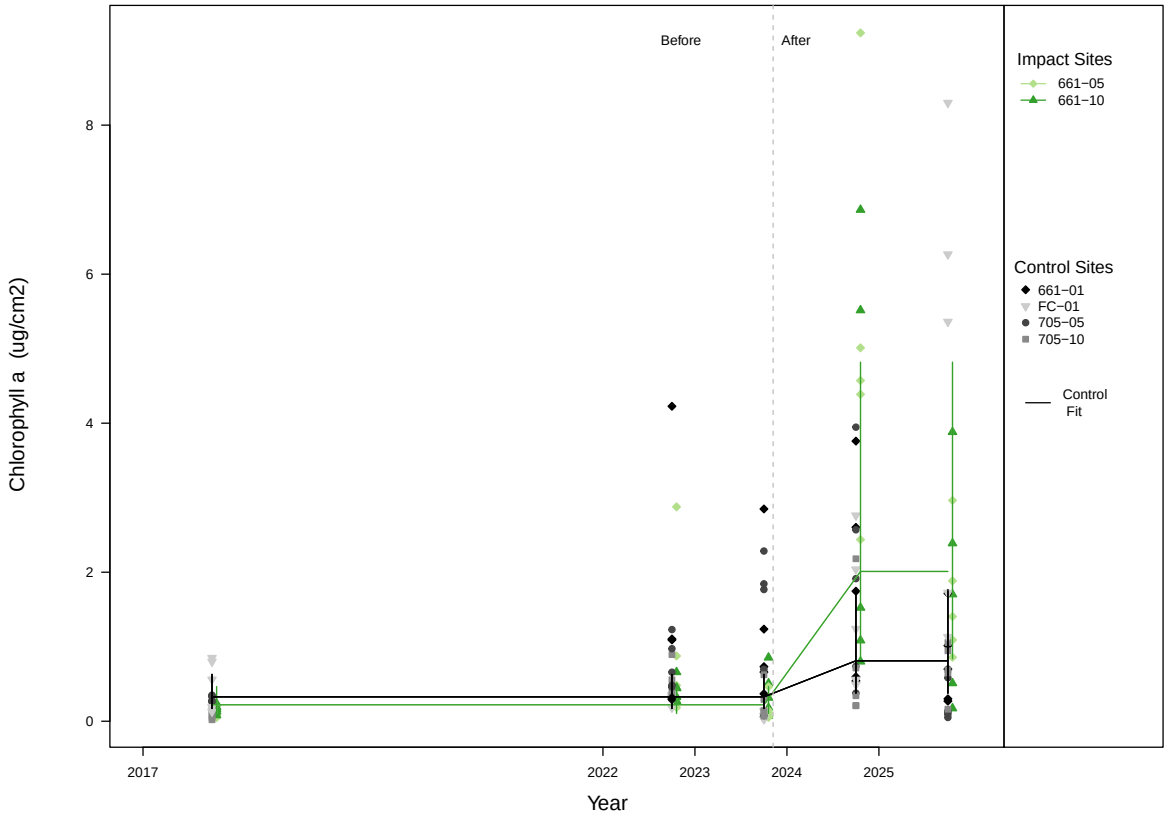
Impact vs.	Estimate	Significance
control sites	0.5652	significant

Conclusion:

The change in Chlorophyll a concentrations at the impact sites from *before* to *after* was significantly (*adjusted p =* 0.0011) different from the change at the control sites, according to the test on the BACI term (*class:period*).

2.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

Variable	Chlorophyll a
Watershed	Creek 661
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	Yes

Appendix C-6 Summary of the 2025 Periphyton Communities

APPENDIX C-6: SUMMARY OF THE 2025 PERIPHYTON COMMUNITIES

A characterization of the 2025 periphyton parameters for Turtle Creek is provided. Graphical presentation for all parameters is provided in Section 5.3 of the main report.

Periphyton biomass (as chlorophyll *a* concentration) was similar to baseline and construction concentrations in 2025 at TC-01 (Figure 5.3-1 of the main report). Periphyton biomass was higher in 2024 (Construction Year 2) and 2025 in TC-10 than the baseline and 2023 (Construction Year 1) at TC-10. Though of a lessor magnitude, a similar trend of higher chlorophyll *a* concentrations in 2024 and 205 was observed at some regional control sites (e.g., 705-10 and FC-01). All periphyton chlorophyll *a* concentrations in 2025, and throughout the monitoring history, were less than the chlorophyll *a* BC WQG-AL (10 µg/cm^2; BC WLRS 2025), including in Turtle Creek.

In Turtle Creek, mean periphyton density in 2025 was within the baseline range (Figure 5.3-2 of the main report). Compared to the baseline years (2022 and 2023), the periphyton community at site TC-10 had a higher proportion of blue-green algae (63% compared to 27% to 35%) and lower proportion of red algae (9% compared to 40% to 42%). Periphyton community richness at site TC-10 and diversity at both sites was higher in 2025 compared to the baseline (Figures 5.3-4 and 5.3-5 of the main report).

There has been no construction in the Turtle Creek watershed to date (i.e., the airstrip has not been constructed), thus the observed changes in periphyton biomass and community in Turtle Creek likely reflect the natural variations within the stream.

Notes:

Shaded cells indicate the mean monthly concentration is greater than the predicted concentration for that month.

Values below detection limit were replaced with half the detection limit for calculations.

[a] 95th percentile concentration + 20% for Total Ammonia-N, Nitrate-N, and Nitrite-N measured in baseline studies between 2016 and September 30, 2022; the lower of the monthly mean Total Phosphorus + 50% or the upper limit of the baseline tropic range for Total Phosphorus.

[b] Mean monthly "after" period concentration from October 2022 to December 2025 (Construction and Operations).

Notes:
< = less than the indicated DL; DL = detection limit; RPD = relative percent difference
Units for metal concentration results and DL is mg/kg; units for moisuture and RPD is %.
wwt indicates that the results are for the wet weight; if not indicated, results are for the dry weight sample.
Light gray shading indicates RPD between 20% and 50%. Dark gray shading indicates RPD greater than 50%.

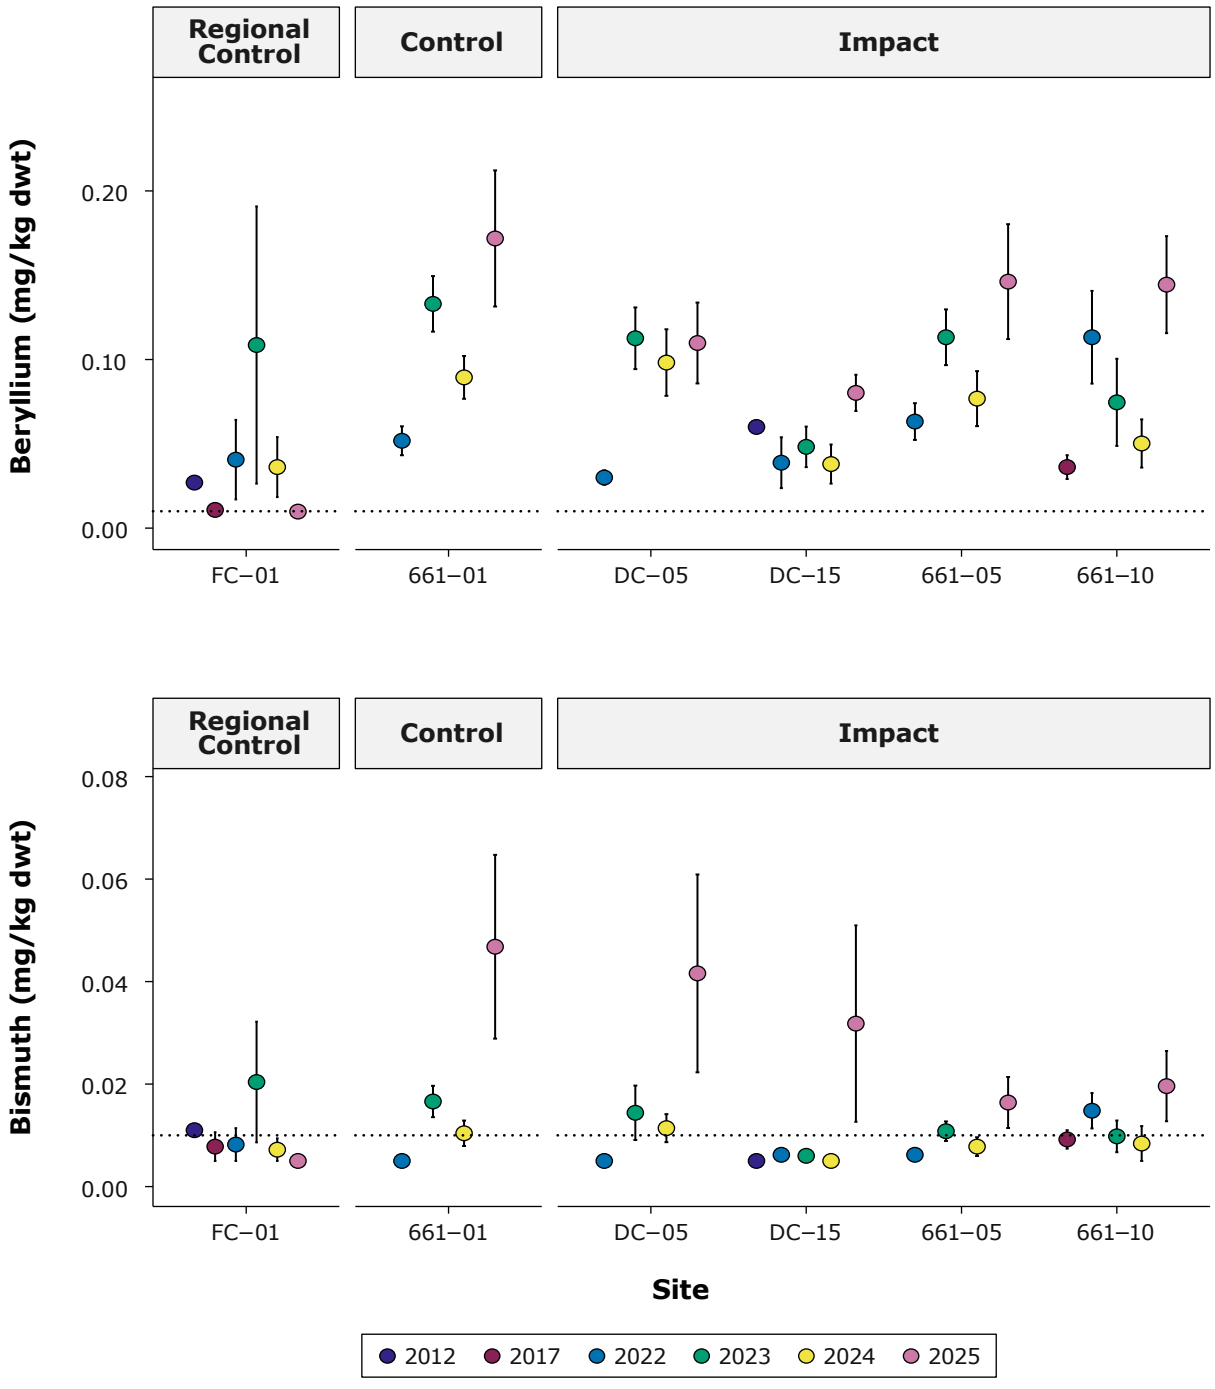
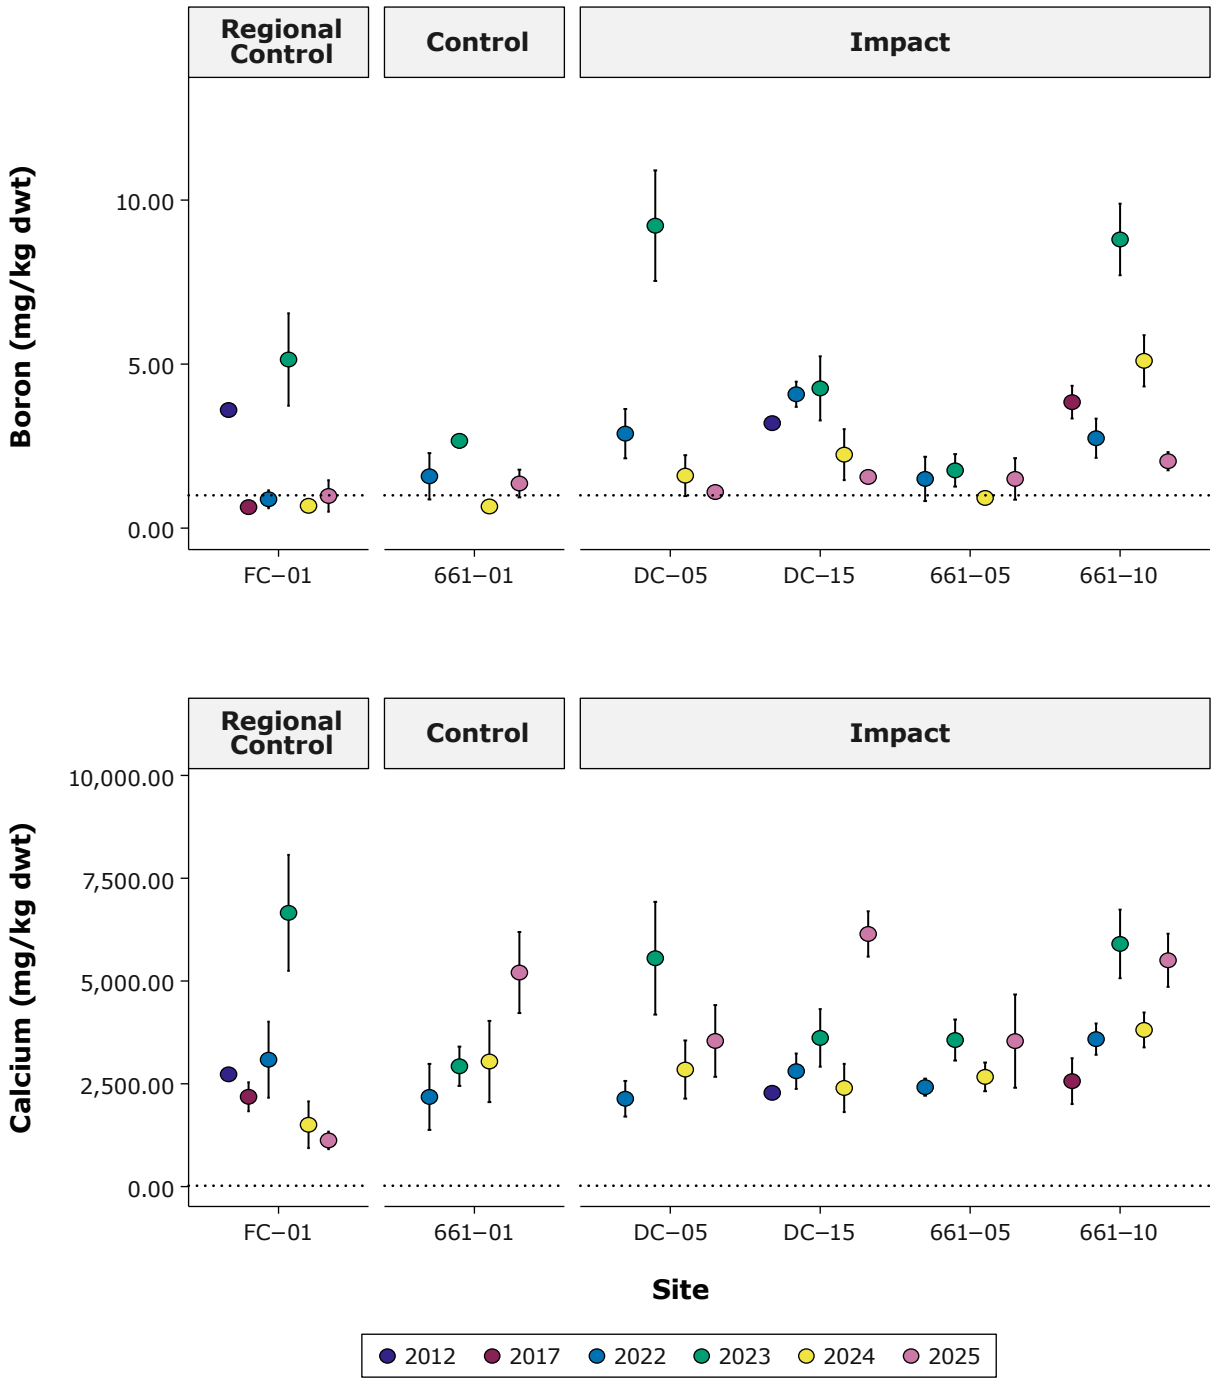
Appendix D-9 Benthic Invertebrate Tissue Metal Graphs

FIGURE D9-1 BERYLLIUM AND BISMUTH CONCENTRATIONS IN BENTHIC INVERTEBRATE TISSUE, BASELINE YEARS (2012, 2017, AND 2022), CONSTRUCTION (2023 AND 2024), AND OPERATIONS (2025)



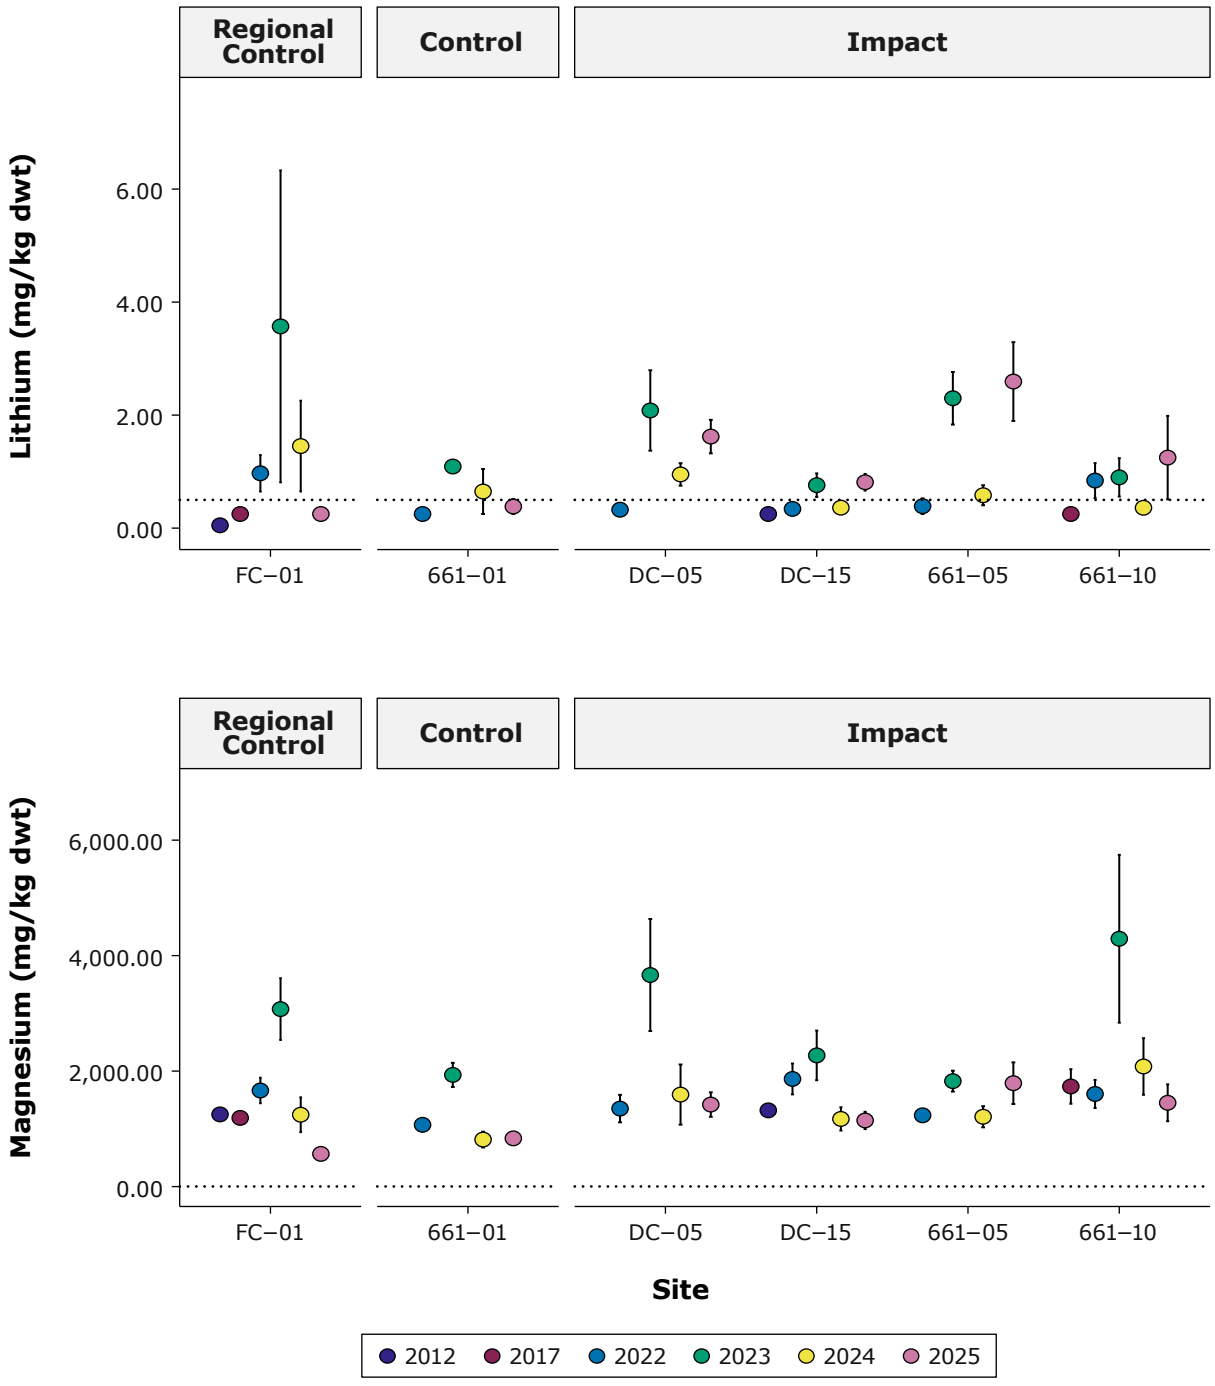
Notes: Black dotted lines indicate detection limits.
The means +- Standard error and values less than dl replaced with half the dl.

FIGURE D9-2 BORON AND CALCIUM CONCENTRATIONS IN BENTHIC INVERTEBRATE TISSUE, BASELINE YEARS (2012, 2017, AND 2022), CONSTRUCTION (2023 AND 2024), AND OPERATIONS (2025)



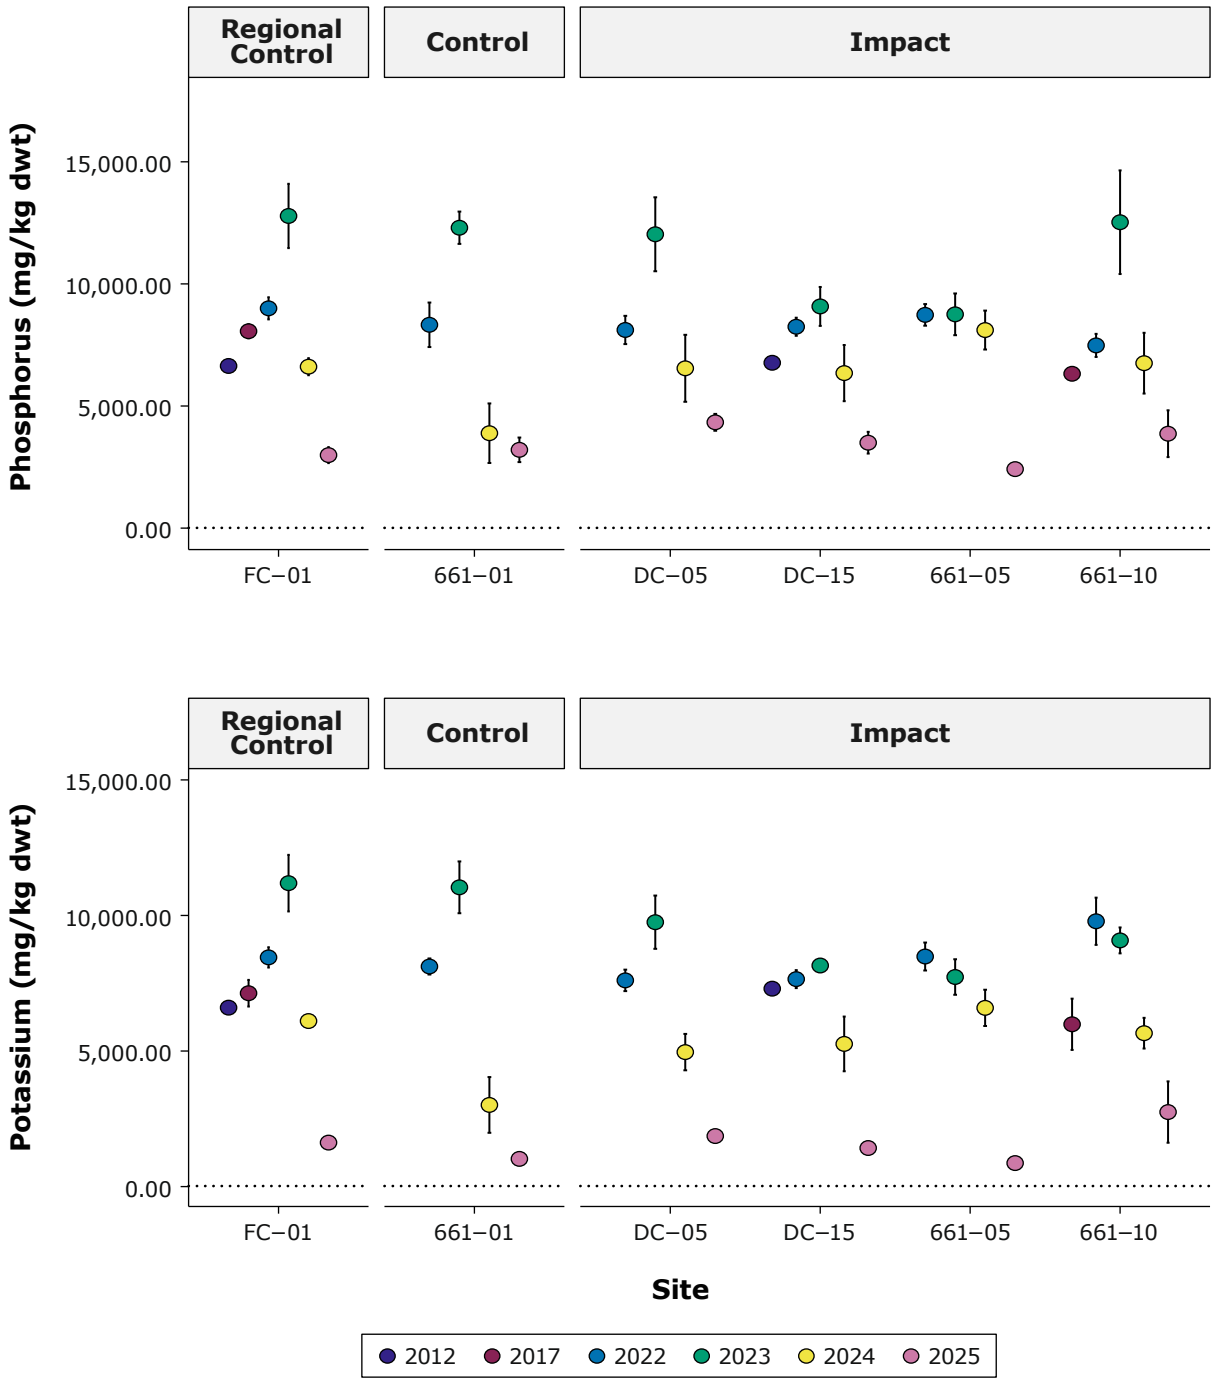
Notes: Black dotted lines indicate detection limits.
The means +- Standard error and values less than dl replaced with half the dl.

FIGURE D9-3 LITHIUM AND MAGNESIUM CONCENTRATIONS IN BENTHIC INVERTEBRATE TISSUE, BASELINE YEARS (2012, 2017, AND 2022), CONSTRUCTION (2023 AND 2024), AND OPERATIONS (2025)



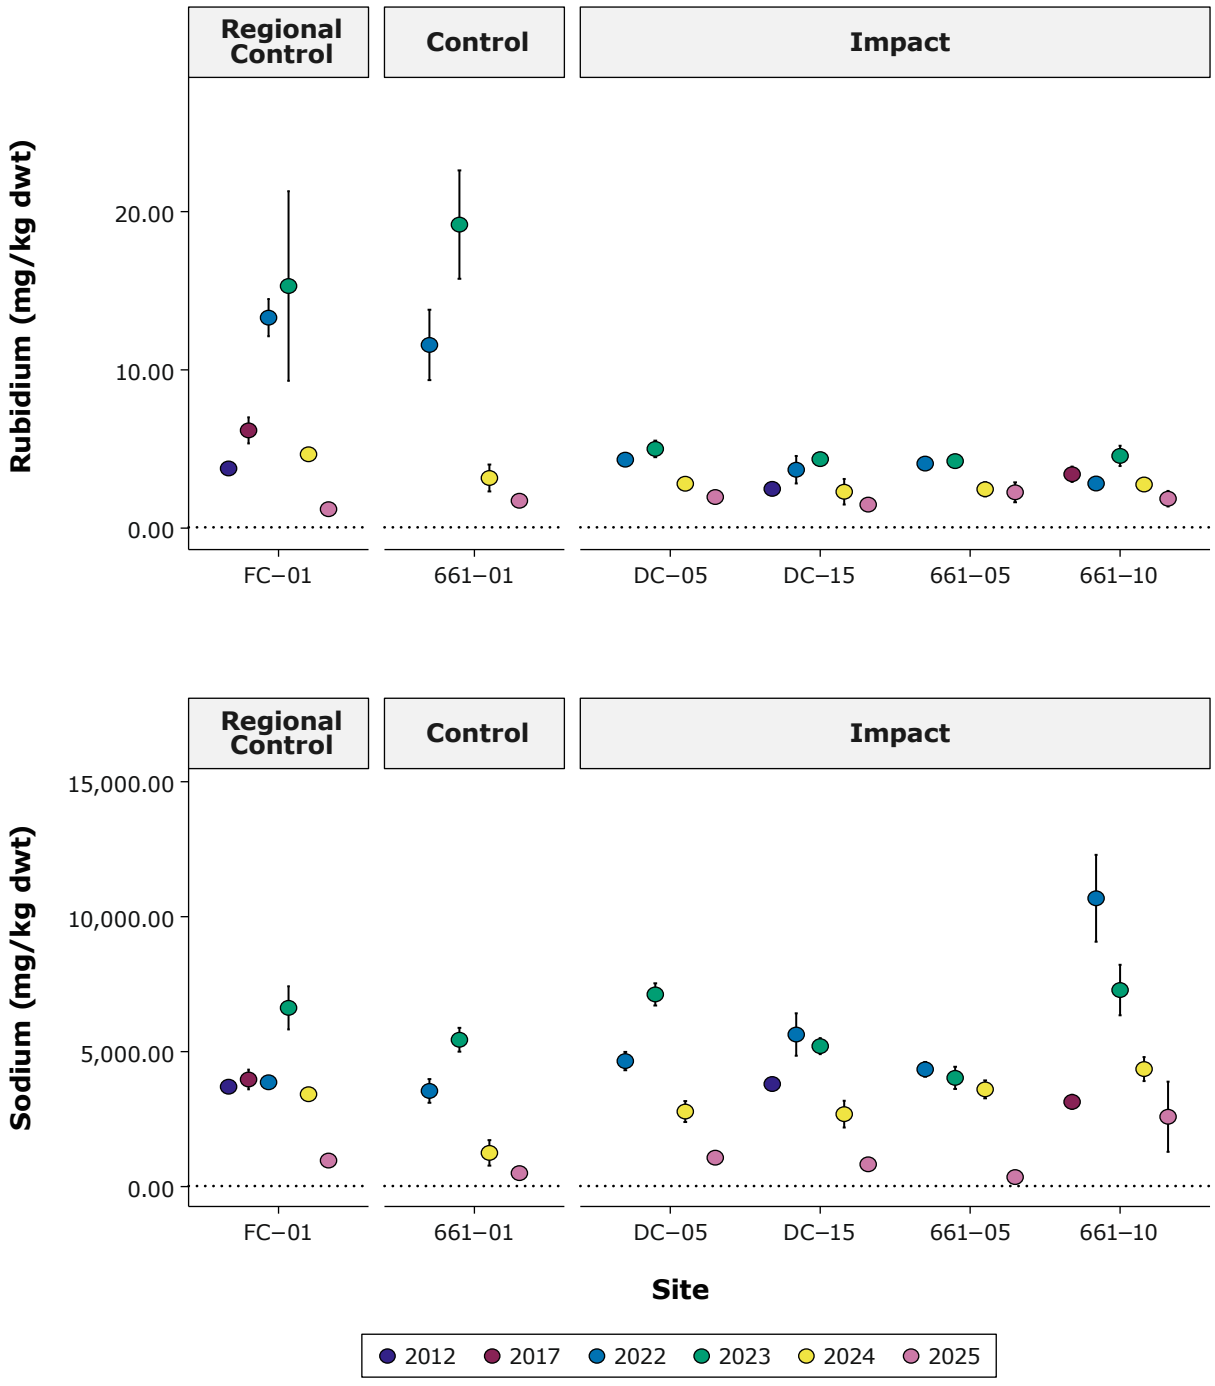
Notes: Black dotted lines indicate detection limits.
The means +- Standard error and values less than dl replaced with half the dl.

FIGURE D9-4 PHOSPHORUS AND POTASSIUM CONCENTRATIONS IN BENTHIC INVERTEBRATE TISSUE, BASELINE YEARS (2012, 2017, AND 2022), CONSTRUCTION (2023 AND 2024), AND OPERATIONS (2025)



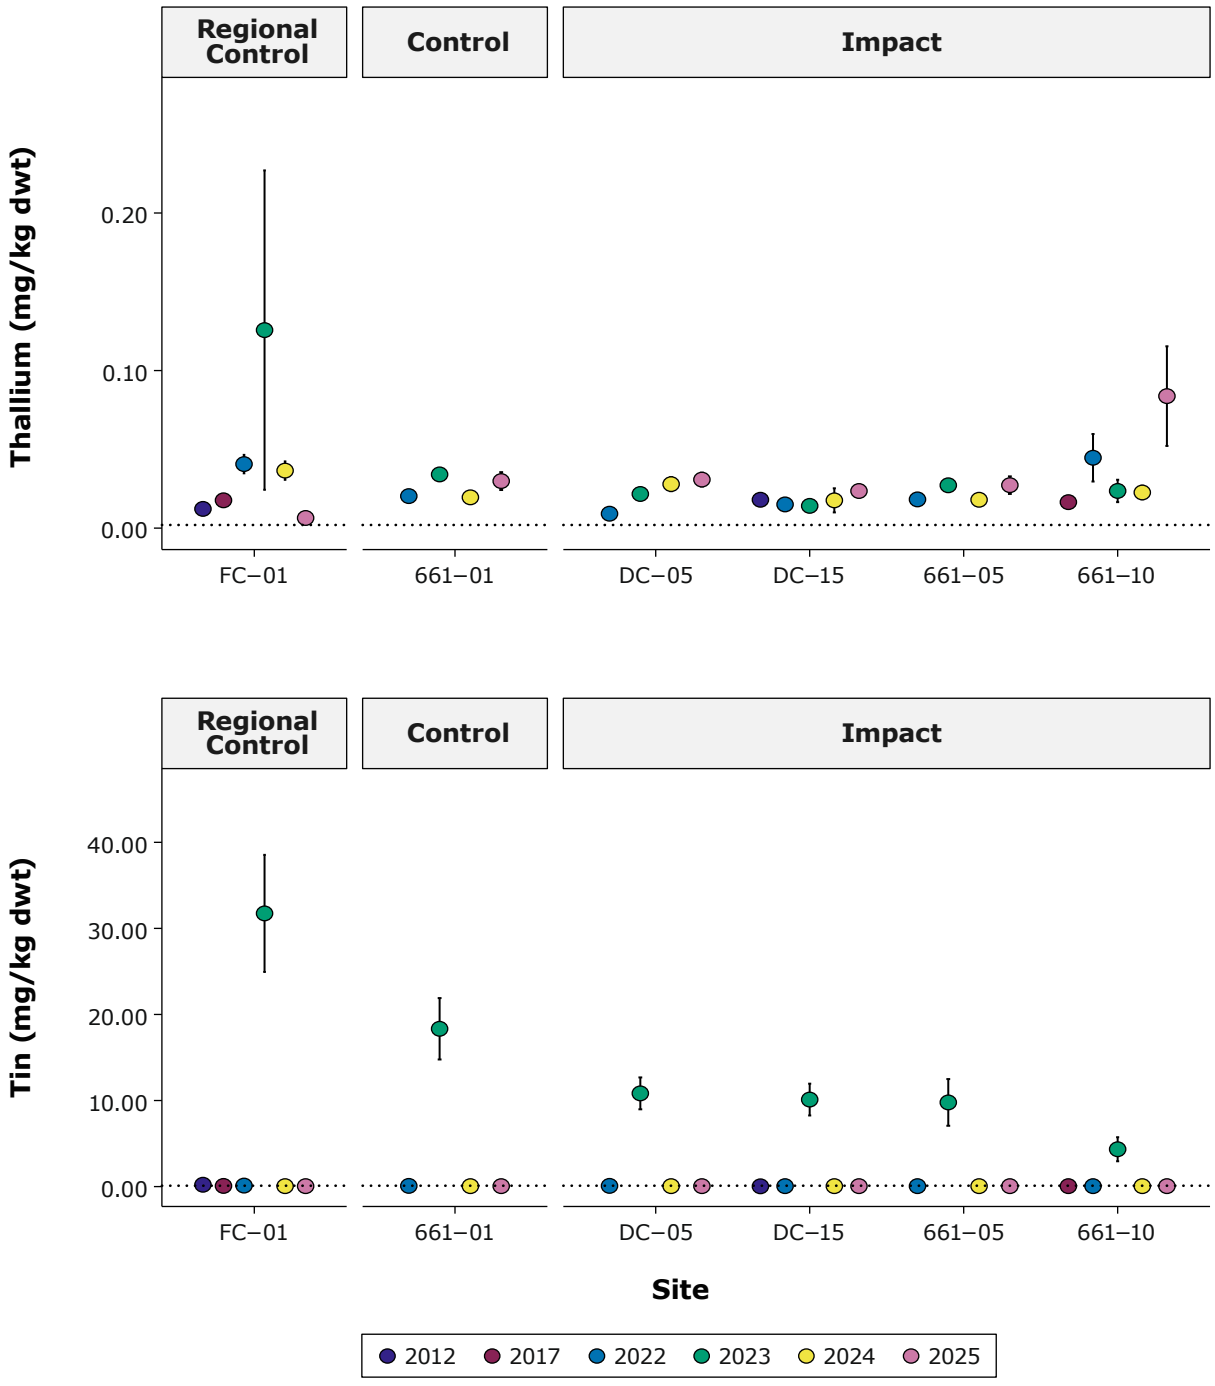
Notes: Black dotted lines indicate detection limits.
The means +- Standard error and values less than dl replaced with half the dl.

FIGURE D9-5 RUBIDIUM AND SODIUM CONCENTRATIONS IN BENTHIC INVERTEBRATE TISSUE, BASELINE YEARS (2012, 2017, AND 2022), CONSTRUCTION (2023 AND 2024), AND OPERATIONS (2025)



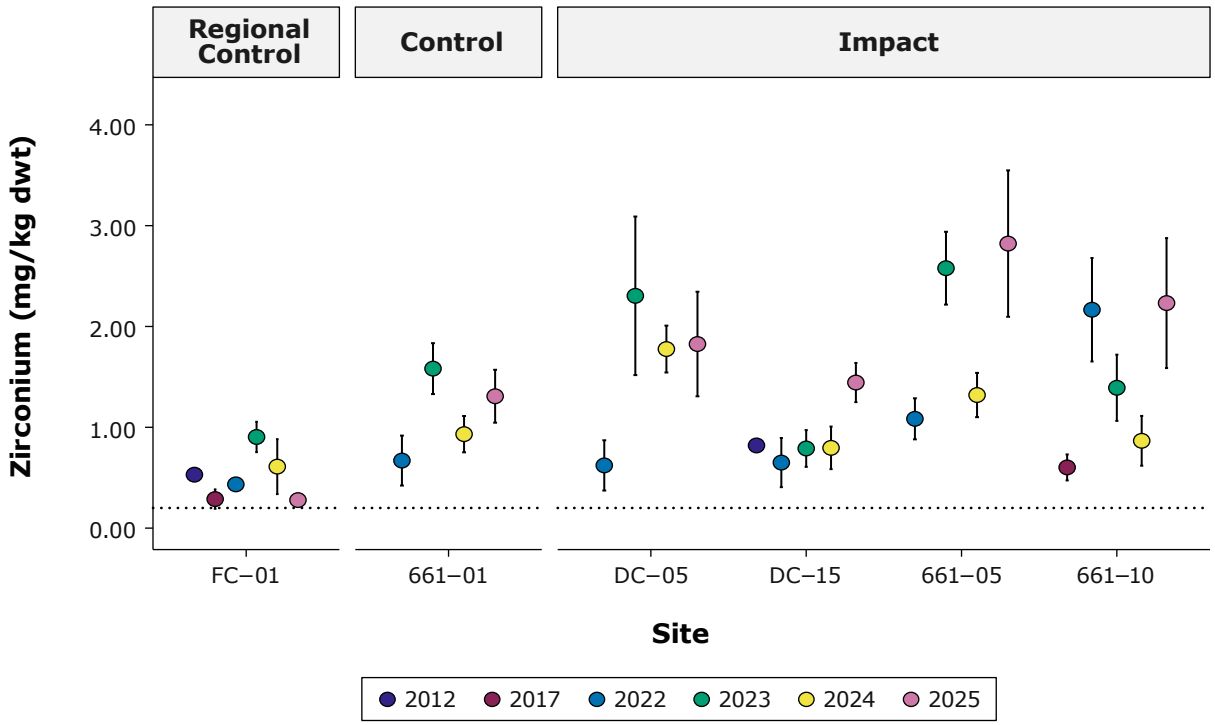
Notes: Black dotted lines indicate detection limits.
The means +- Standard error and values less than dl replaced with half the dl.

FIGURE D9-6 THALLIUM AND TIN CONCENTRATIONS IN BENTHIC INVERTEBRATE TISSUE, BASELINE YEARS (2012, 2017, AND 2022), CONSTRUCTION (2023 AND 2024), AND OPERATIONS (2025)



Notes: Black dotted lines indicate detection limits.
The means +- Standard error and values less than dl replaced with half the dl.

FIGURE D9-7 ZIRCONIUM CONCENTRATIONS IN BENTHIC INVERTEBRATE TISSUE, BASELINE YEARS (2012, 2017, AND 2022), CONSTRUCTION (2023 AND 2024), AND OPERATIONS (2025)



Notes: Black dotted lines indicate detection limits.
The means +- Standard error and values less than dl replaced with half the dl.

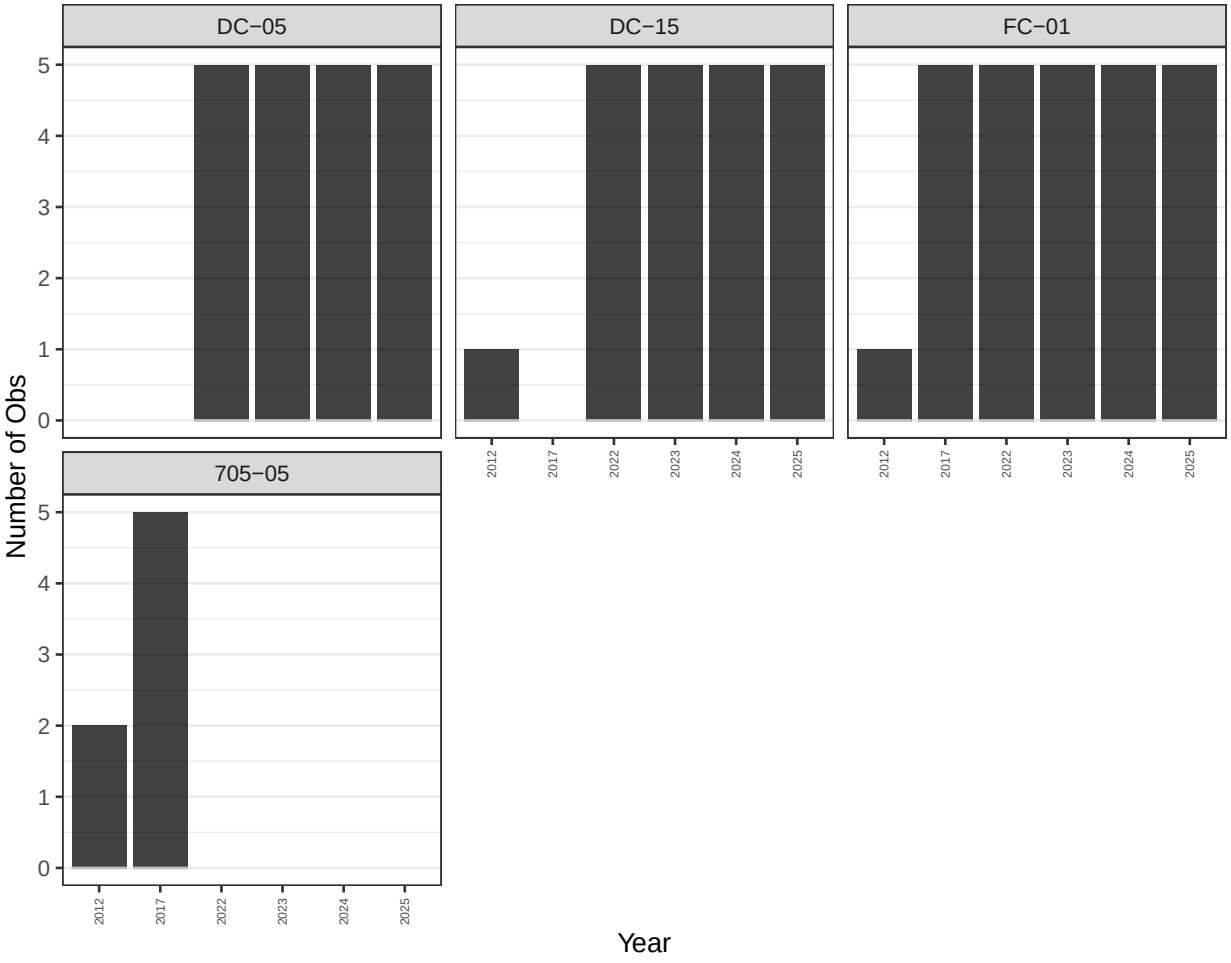
Appendix D-11: Results of the 2025 Benthic Invertebrate Tissue Metal Before-After-Control-Impact Analysis

D-11.1.1 Aluminum

1 Davidson Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

1.2 Sample Sizes for Modelling

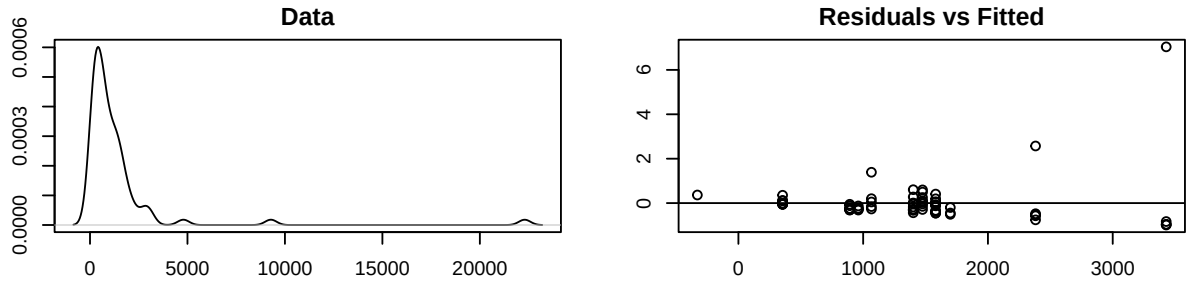
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Davidson Creek	DC-05	before	10	680.5	0
Davidson Creek	DC-05	after	10	1920.0	0
Davidson Creek	DC-15	before	11	556.0	0
Davidson Creek	DC-15	after	10	1038.0	0
Davidson Creek	FC-01	before	16	813.0	0
Davidson Creek	FC-01	after	10	484.0	0
Davidson Creek	705-05	before	7	215.0	0

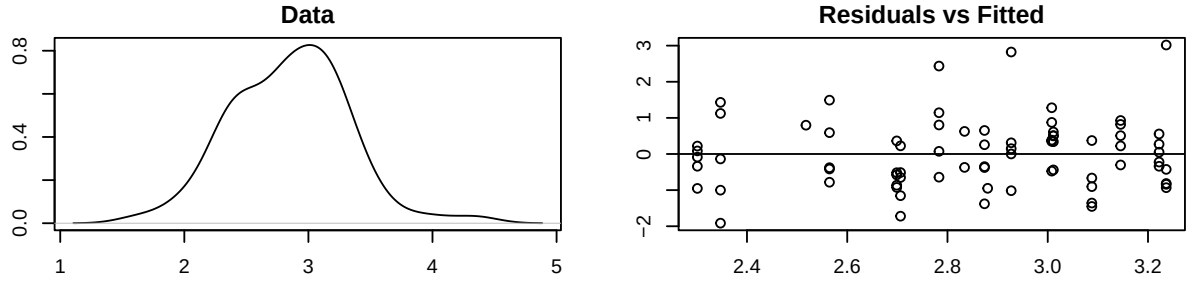
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	FC-01	2023	9	control	before	22300	3429	7.037	Y

Outliers on log scale:

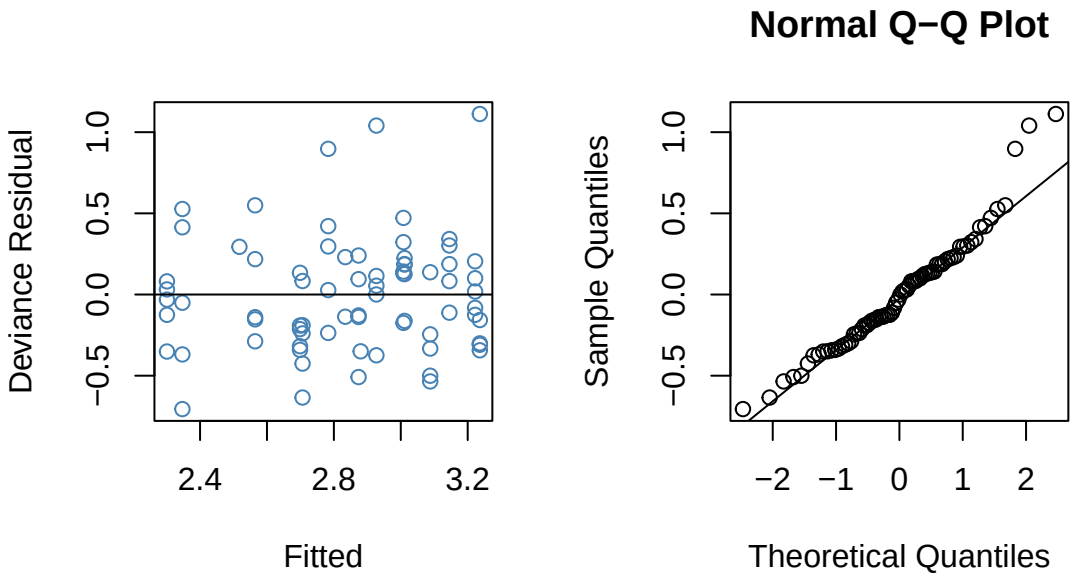
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	FC-01	2023	9	control	before	4.348	3.236	3.017	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.01820	0.01820	1	1.734	0.1340	0.7540	
period	0.07273	0.07273	1	3.806	0.5354	0.5070	
class:period	1.54907	1.54907	1	66.810	11.4031	0.0012	0.00736

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
74	0.1746	20%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

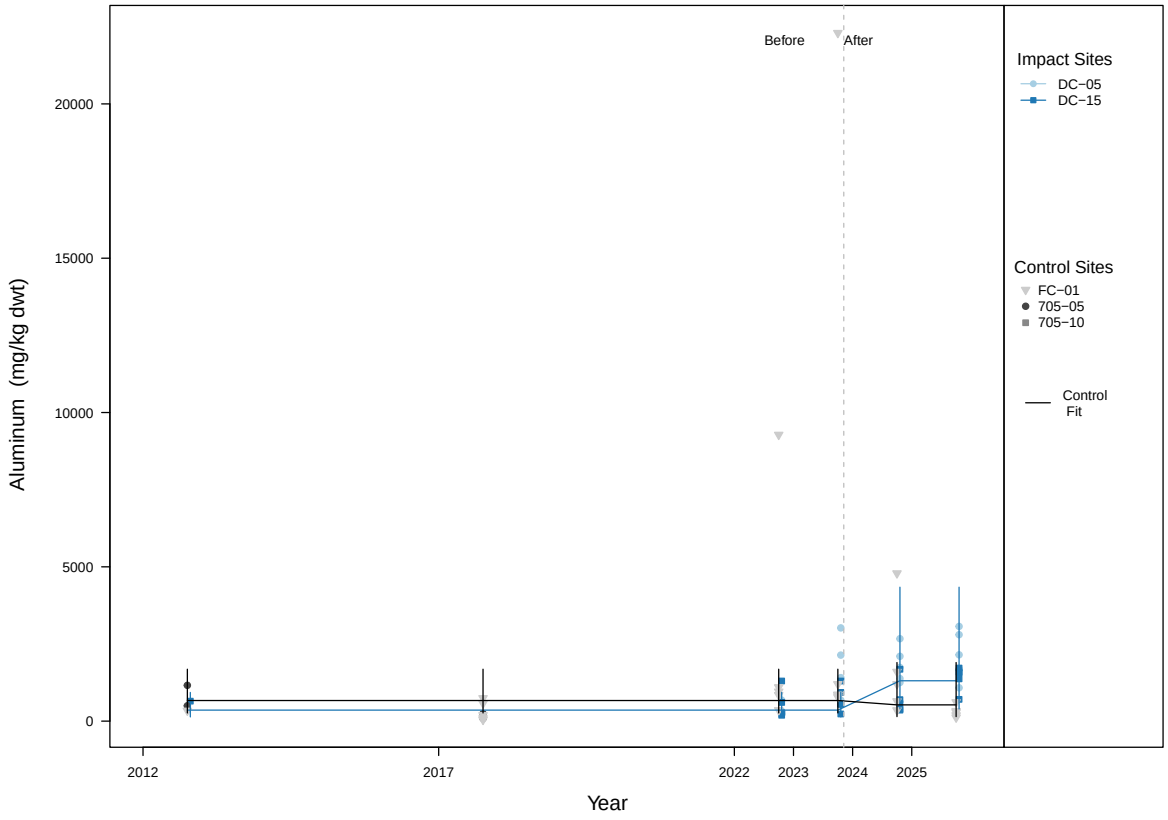
Impact vs.	Estimate	Significance
control sites	0.6673	significant

Conclusion:

The change in Aluminum concentrations at the impact sites from *before* to *after* was significantly (*adjusted p* = 0.0074) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

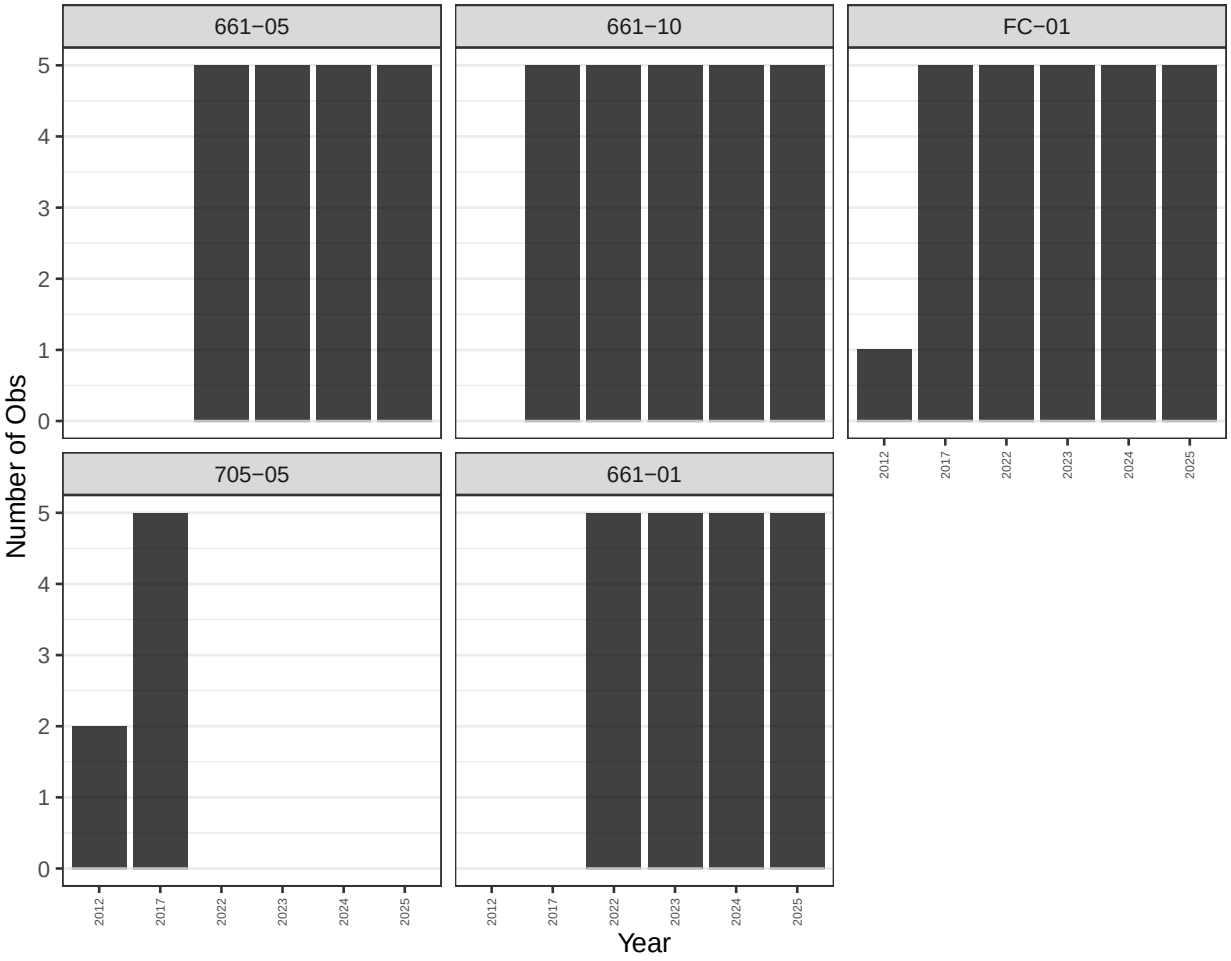
Variable	Aluminum
Watershed	Davidson Creek
Waterbody	Stream

Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	Yes

2 Creek 661

2.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

2.2 Sample Sizes for Modelling

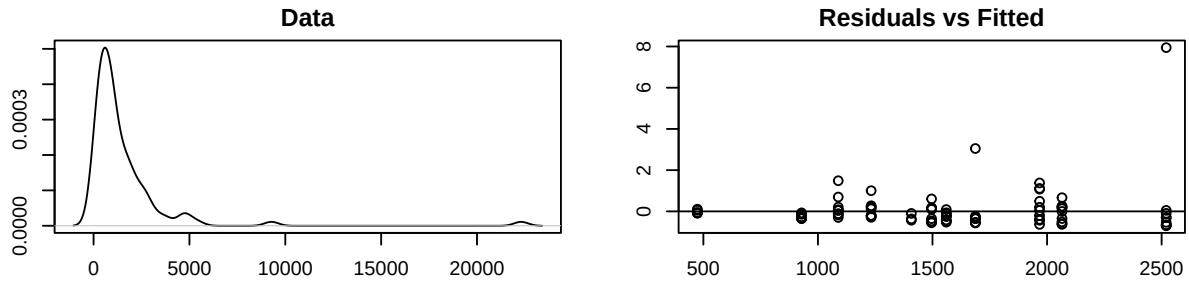
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Creek 661	661-05	before	10	1455.0	0
Creek 661	661-05	after	10	1425.0	0
Creek 661	661-10	before	15	736.0	0
Creek 661	661-10	after	10	1020.0	0
Creek 661	FC-01	before	16	813.0	0
Creek 661	FC-01	after	10	484.0	0
Creek 661	705-05	before	7	215.0	0
Creek 661	661-01	before	10	883.5	0
Creek 661	661-01	after	10	1510.0	0

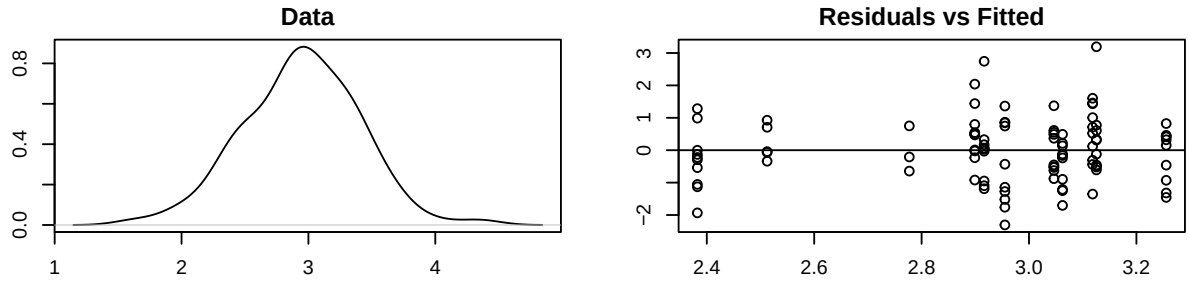
2.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	FC-01	2023	9	control	before	22300	2520	7.945	Y
Creek 661	FC-01	2022	9	control	before	9280	1687	3.050	Y

Outliers on log scale:

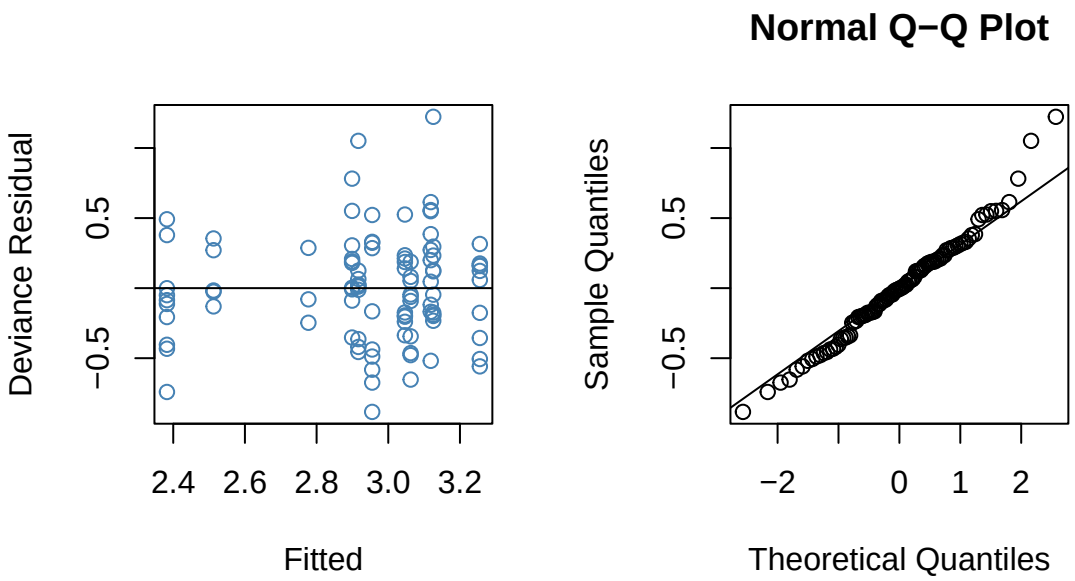
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	FC-01	2023	9	control	before	4.348	3.126	3.192	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

2.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.492493	0.492493	1	90.960	3.3573	0.0702	
period	0.041292	0.041292	1	3.689	0.2815	0.6260	
class:period	0.006407	0.006407	1	90.960	0.0437	0.8350	0.835

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
98	0.0467	6%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-05, 661-10) and control sites (661-01, FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

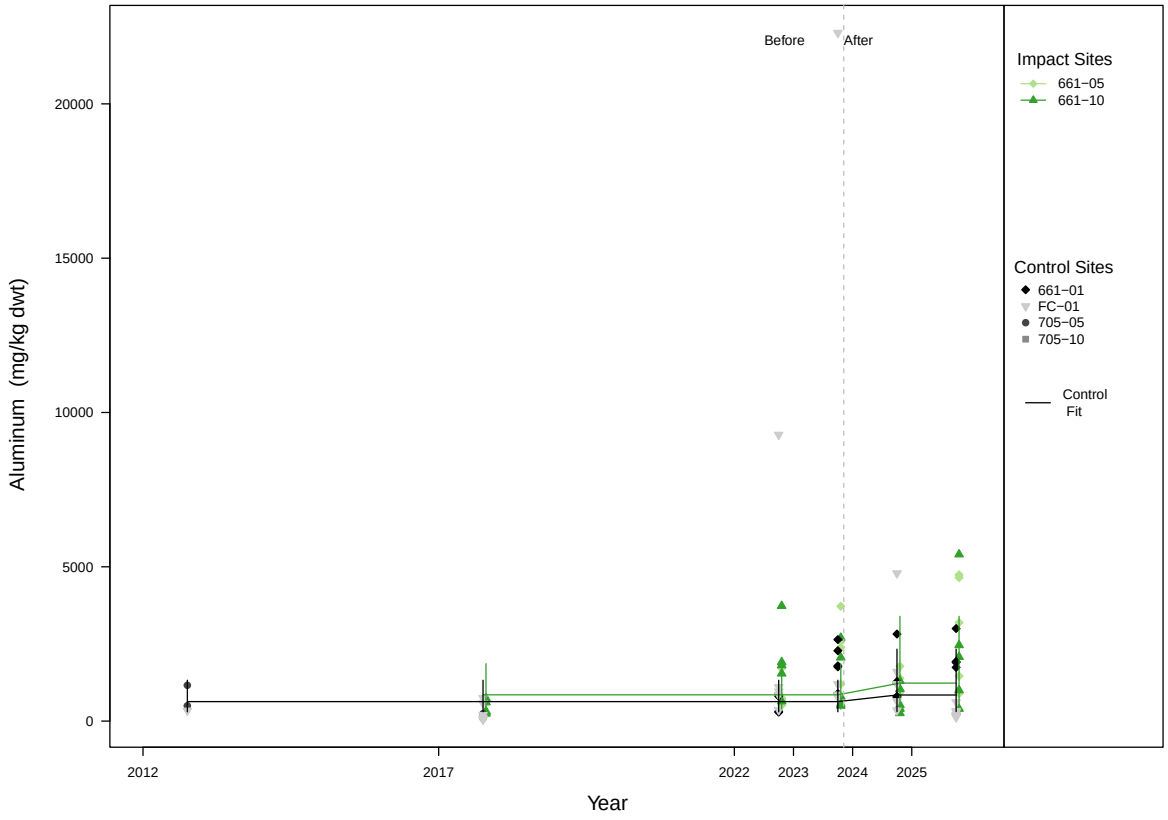
Impact vs.	Estimate	Significance
control sites	0.0335	not significant

Conclusion:

The change in Aluminum concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.835) different from the change at the control sites, according to the test on the BACI term (*class:period*).

2.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

Variable	Aluminum
Watershed	Creek 661
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed

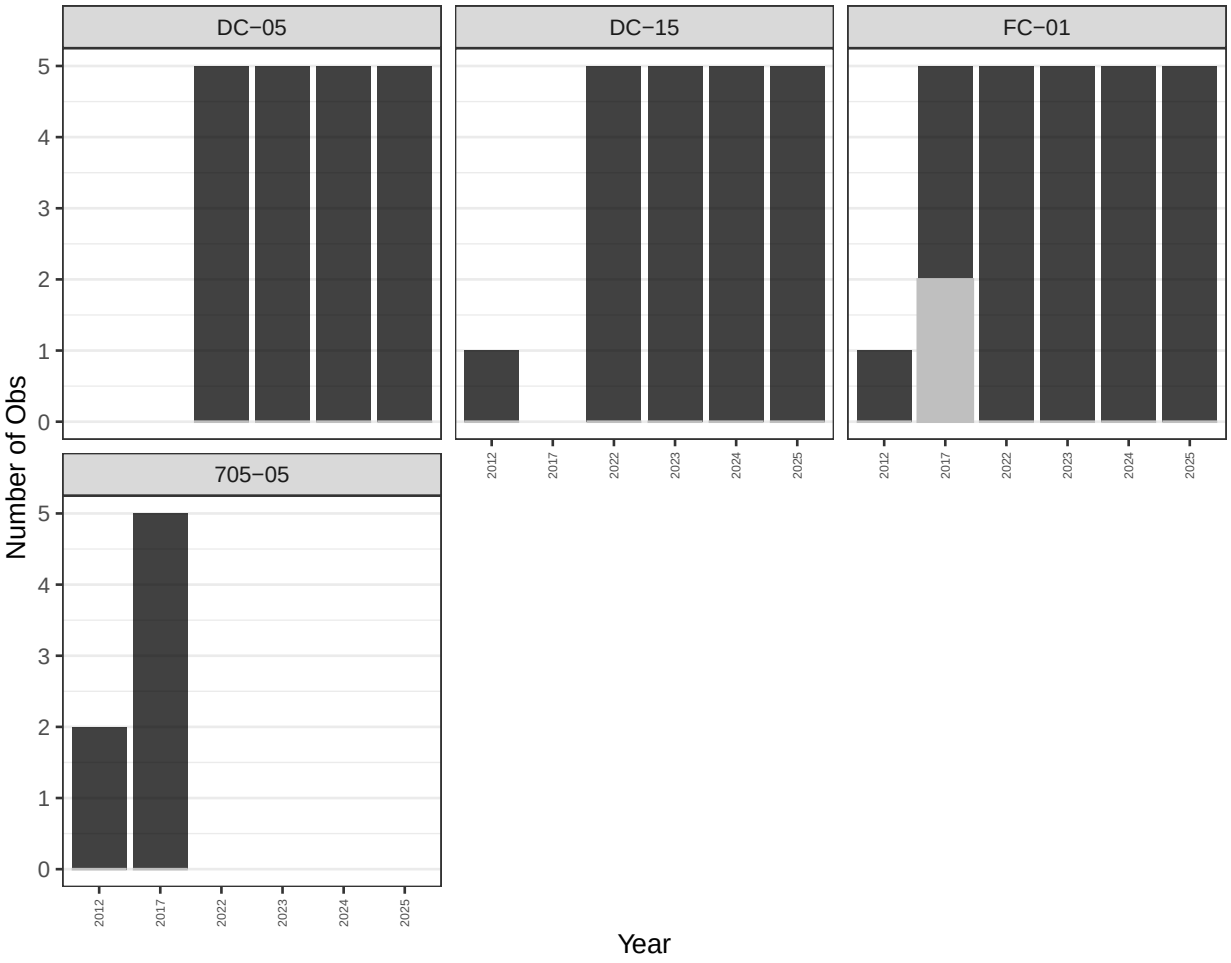
Is BACI significant	No

D-11.1.2 Mercury

1 Davidson Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

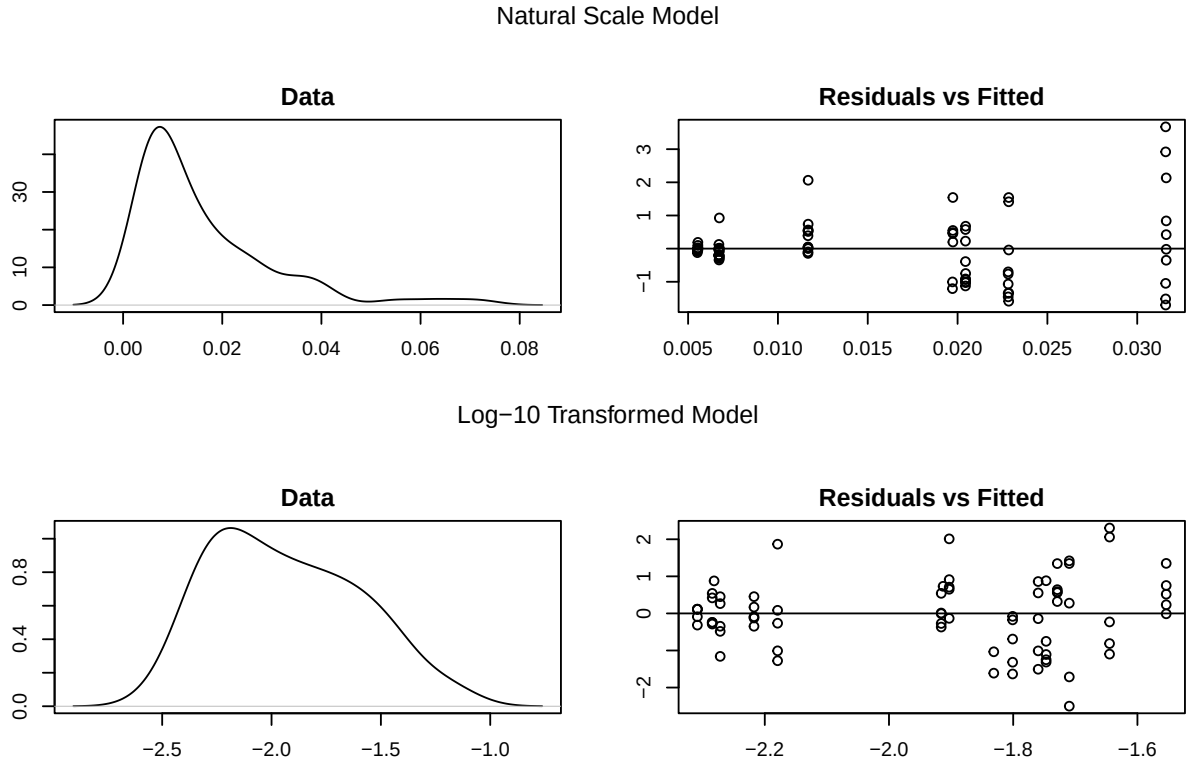
1.2 Sample Sizes for Modelling

The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Davidson Creek	DC-05	before	10	0.0114	0.0
Davidson Creek	DC-05	after	10	0.0338	0.0
Davidson Creek	DC-15	before	11	0.0159	0.0
Davidson Creek	DC-15	after	10	0.0128	0.0
Davidson Creek	FC-01	before	16	0.0052	12.5
Davidson Creek	FC-01	after	10	0.0052	0.0
Davidson Creek	705-05	before	7	0.0247	0.0

1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	DC-05	2025	9	impact	after	0.0715	0.0316	3.673	Y

Outliers on log scale:

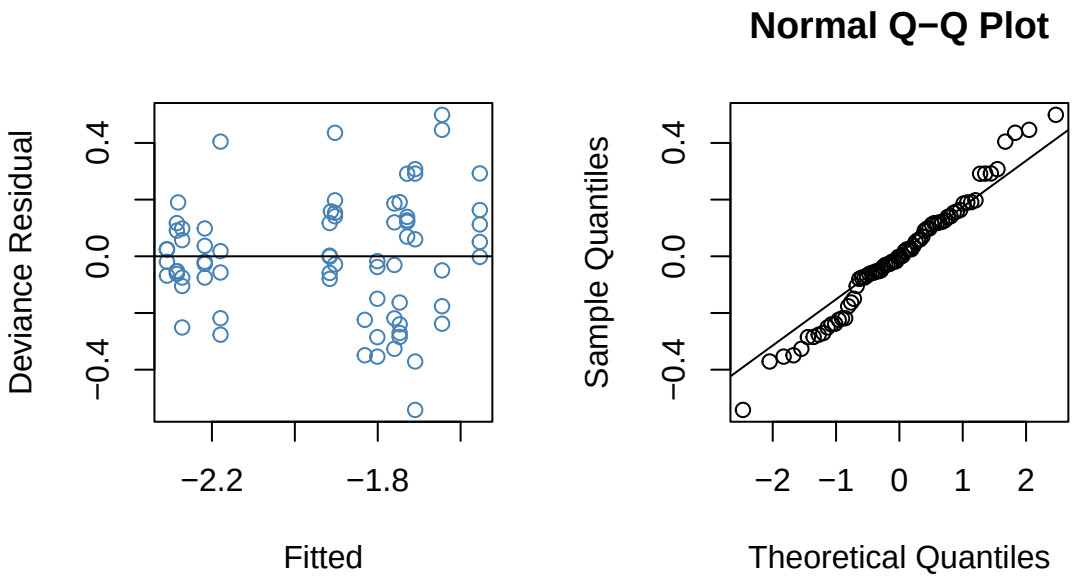
None

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	0.06010	0.06010	1	2.045	1.2801	0.373	
period	0.02185	0.02185	1	3.299	0.4655	0.540	
class:period	0.06844	0.06844	1	68.207	1.4577	0.231	0.347

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
74	0.2045	27%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

Impact vs.	Estimate	Significance

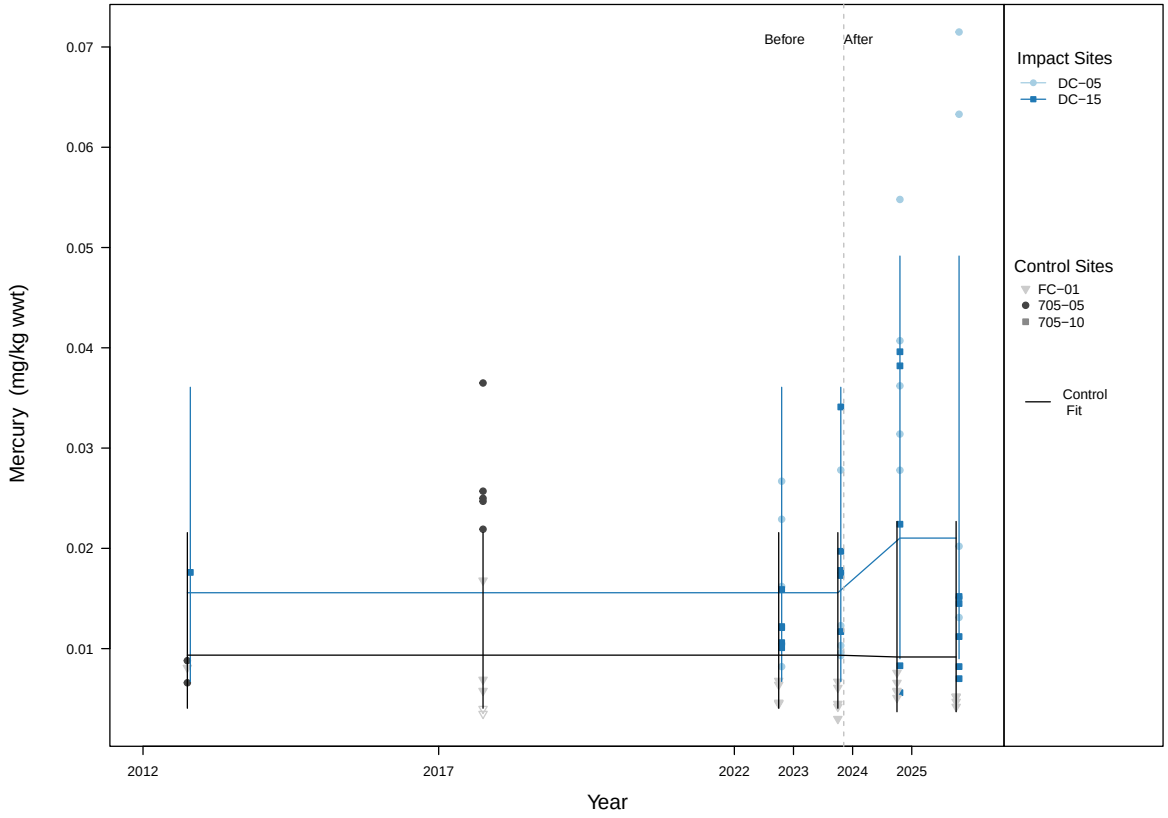
control sites	0.1389	not significant

Conclusion:

The change in Mercury concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.347) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Open symbols represent cases where the results were below the sample detection limit. Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

Variable	Mercury
Watershed	Davidson Creek

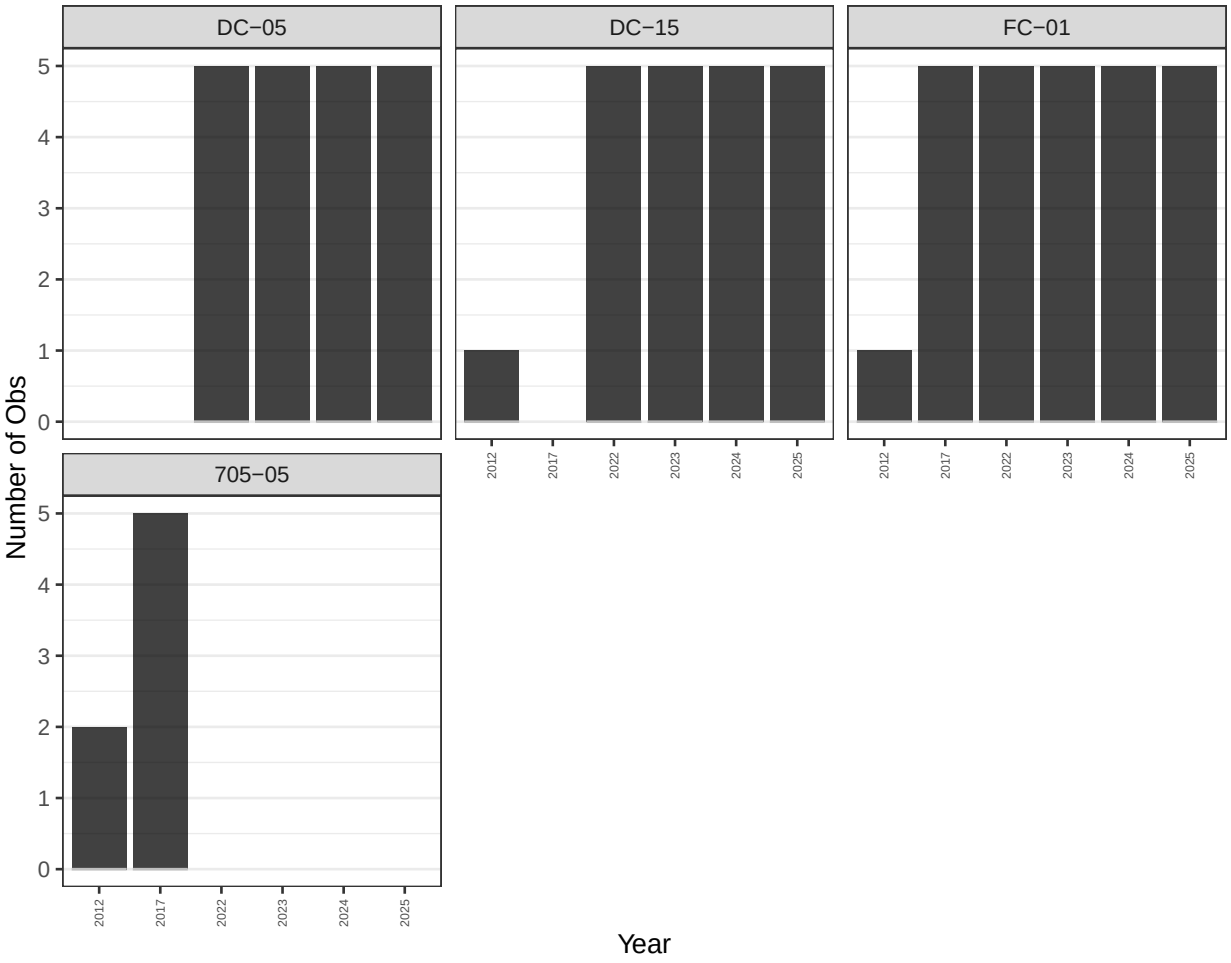
D-11.1.3 Selenium

1 Davidson Creek

1.1 Censored Data

The following charts indicate the number of measurements taken in each year from each stream that were below the detection limit (light gray) or above the detection limit (dark gray).



Observations at or below the analytical detection limit were considered censored. Data were excluded from the analysis if greater than 70% of observations from a site were censored or if greater than 50% of observations in a site's sampling year were censored. If more than 10% of observations from a site in a sampling year were censored, data were flagged to caution interpretation of results. The following observations were excluded:

None

1.2 Sample Sizes for Modelling

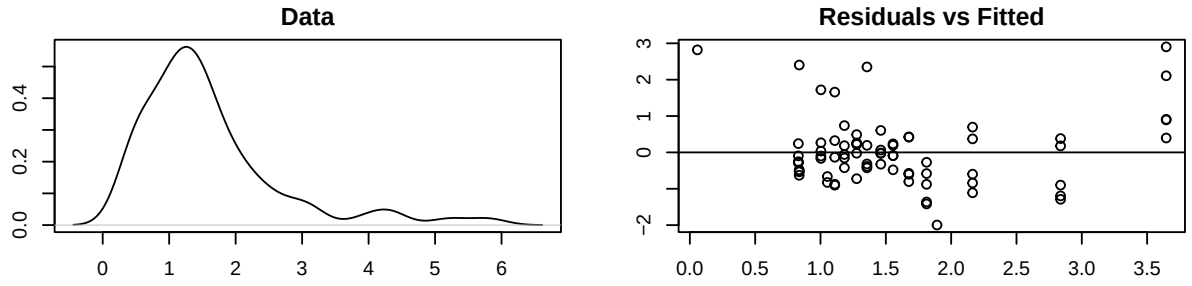
The remaining sample sizes per site and period are summarised in the table below.

Watershed	Site	Period	N	Median	% Censored
Davidson Creek	DC-05	before	10	1.52	0
Davidson Creek	DC-05	after	10	1.38	0
Davidson Creek	DC-15	before	11	1.16	0
Davidson Creek	DC-15	after	10	0.70	0
Davidson Creek	FC-01	before	16	2.08	0
Davidson Creek	FC-01	after	10	1.48	0
Davidson Creek	705-05	before	7	0.45	0

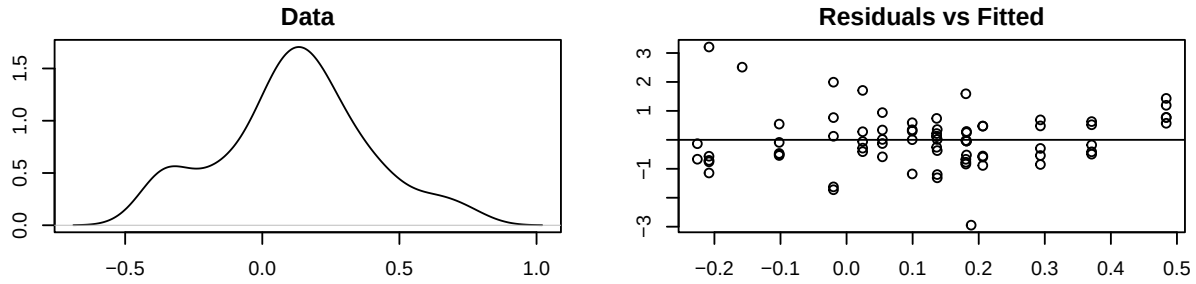
1.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

None

Outliers on log scale:

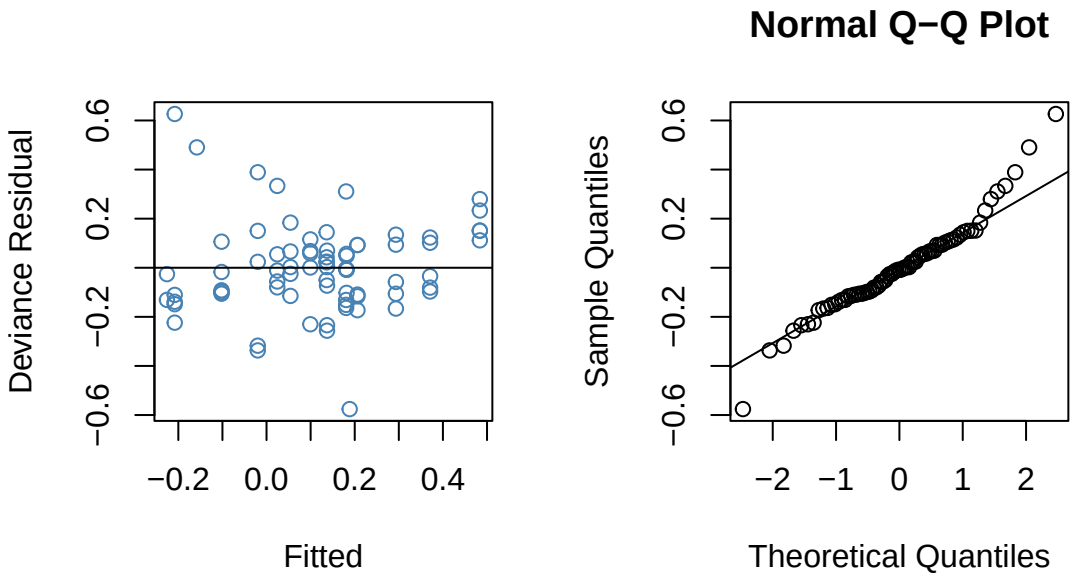
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Davidson Creek	705-05	2017	9	control	before	0.4183	-0.2082	3.207	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

1.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	8.54e-05	8.54e-05	1	2.062	0.0022	0.966	
period	2.103e-02	2.103e-02	1	3.710	0.5509	0.502	
class:period	7.372e-02	7.372e-02	1	66.632	1.9314	0.169	0.342

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
74	0.0277	5%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (DC-05, DC-15) and control sites (FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

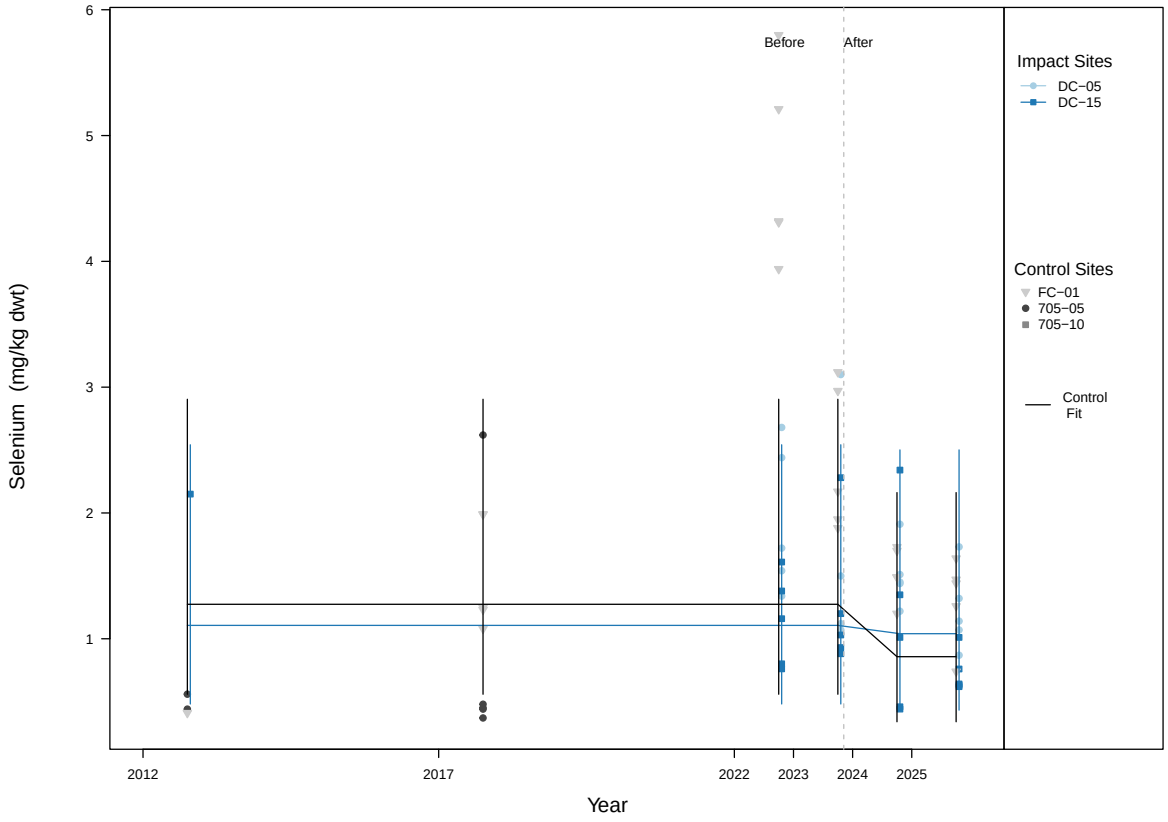
Impact vs.	Estimate	Significance
control sites	0.1452	not significant

Conclusion:

The change in Selenium concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.342) different from the change at the control sites, according to the test on the BACI term (*class:period*).

1.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

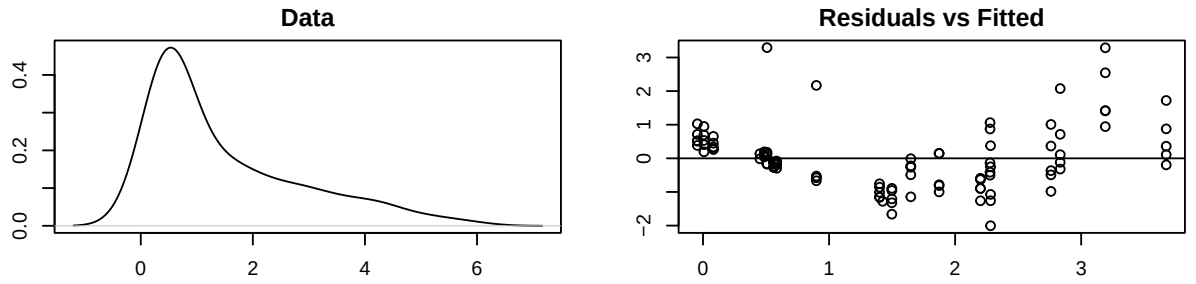
Creek 661	661-01	before	10	0.480	0
Creek 661	661-01	after	10	0.450	0

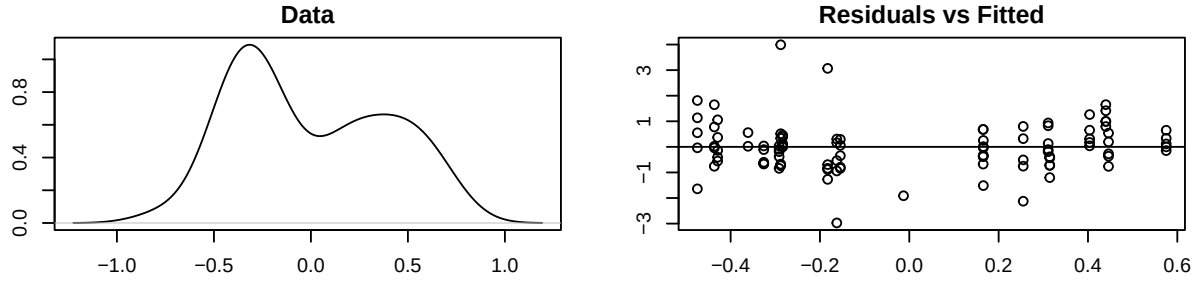
2.3 Initial Model Fit

Initially a model was fit to all sites to assess the need for transformations.

Natural Scale Model



Log−10 Transformed Model



Outliers

The following is a summary of outliers identified (if any) using preliminary regression models. All data points were plotted in the summary figures. The analysis needs to be interpreted with care and in conjunction with graphical displays if large outliers are present.

Outliers on natural scale:

Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-01	2024	9	control	after	3.12	0.5075	3.293	Y
Creek 661	FC-01	2022	9	control	before	5.80	3.1914	3.288	Y

Outliers on log scale:

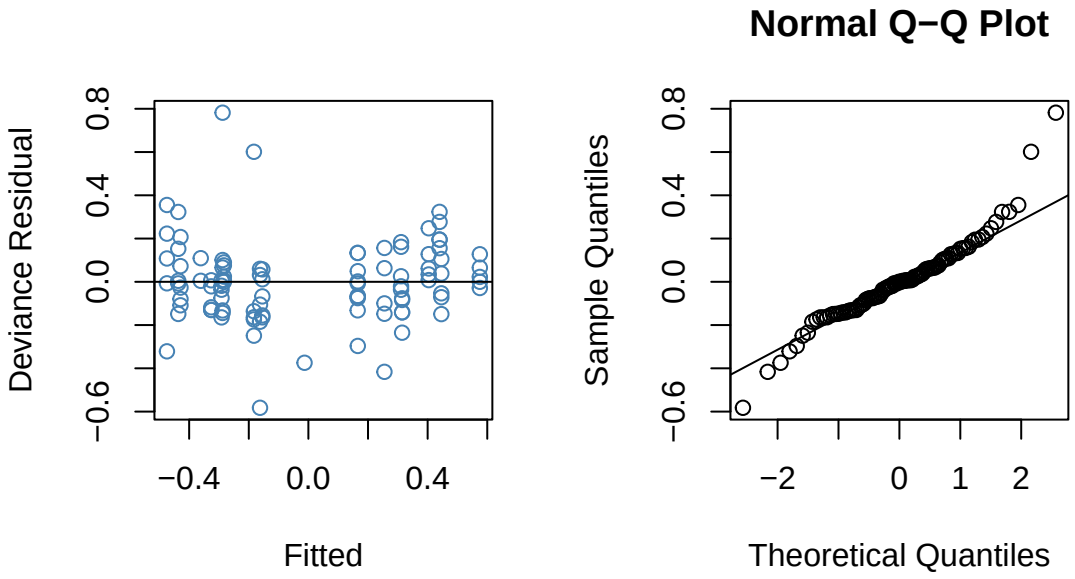
Watershed	Site	Year	Month	Class	Period	Value	Fitted	Std. Resid	Detected
Creek 661	661-01	2024	9	control	after	0.4942	-0.2878	3.992	Y
Creek 661	705-05	2017	9	control	before	0.4183	-0.1828	3.068	Y

Based on examination of the residuals, the log-10 transformed data were selected for analysis. No outliers were removed prior to analysis.

2.4 Before-After Control-Impact Linear Modeling

A models was fit to compare impact sites with control sites.

Plot of Standardized Residuals and Fitted Values



Results of the ANOVA test on the fixed effects of the model:

	Sum Sq.	Mean Sq.	NumDF	DenDF	F value	p	p adjusted
class	1.220e-03	1.220e-03	1	2.978	0.0318	0.870	
period	9.84e-05	9.84e-05	1	3.769	0.0026	0.962	
class:period	1.160e-02	1.160e-02	1	87.384	0.3023	0.584	0.701

Results of the observed power calculation for the between-effect test on the fixed effects for repeated-measures ANOVA analysis at a significance level of 0.05:

Sample Size	Effect Size (f2)	Expected Power	Power Test
98	0.0057	5%	Repeated-Measures ANOVA

Summary of BACI contrasts for relative difference between changes from the *before* to *after* in impact sites (661-05, 661-10) and control sites (661-01, FC-01, 705-05, 705-10), with p value adjusted for multiple comparisons:

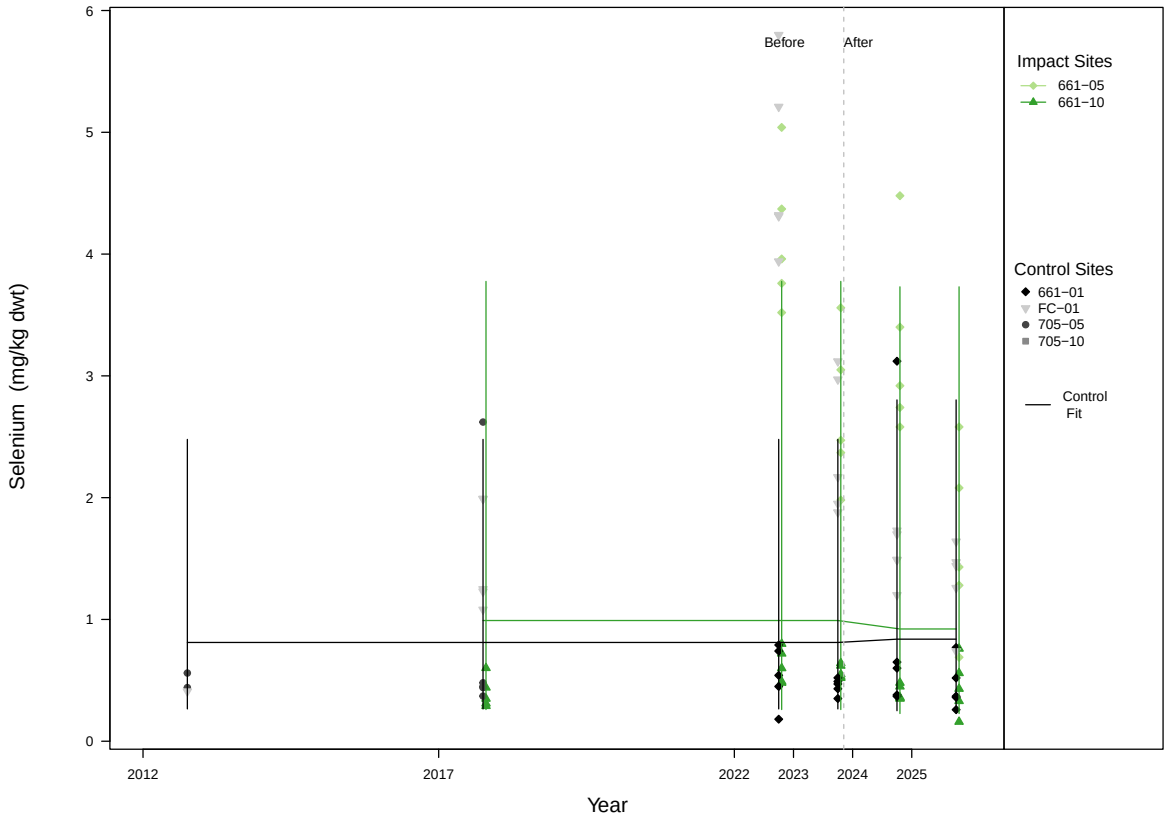
Impact vs.	Estimate	Significance
control sites	-0.0458	not significant

Conclusion:

The change in Selenium concentrations at the impact sites from *before* to *after* was not significantly (*adjusted p =* 0.701) different from the change at the control sites, according to the test on the BACI term (*class:period*).

2.5 Model Summary

The overall performance of the model is shown in the plot below. All the observations are plotted along with the model estimates. The model fitted values and 95% confidence intervals are indicated as lines and errors.



Note: Model fitted values are based on site class and period. Error bars indicate 95% confidence intervals. The positions of data along the x-axis are adjusted for legibility. Modelled log-transformed values were converted back to natural scale.

Final Summary Table

Variable	Selenium
Watershed	Creek 661
Waterbody	Stream
Streams Removed	None
Data Transformation	Log-10 transformed
Model Type	Linear Mixed Effects Regression
Is BACI significant	No

1.0 Introduction

1.1 Project Overview

The Blackwater Gold Mine (the Mine) is a gold and silver open pit mine located in Central British Columbia (BC), approximately 112 kilometres (km) southwest of Vanderhoof, 160 km southwest of Prince George, and 446 km northeast of Vancouver. The Mine is located within the traditional territories of the Lhoosk'uz Dené Nation, Ulkatcho First Nation, Skin Tyee Nation, and the Tsilhqot'in Nation. The Mine's access road and transmission line cross the traditional territories of the Nadleh Whut'en First Nation, Saik'uz First Nation, Stellat'en First Nation, Nazko First Nation, Nee Tahi Buhn Band, Cheslatta Carrier Nation, and the Yekooche First Nation (BC Environmental Assessment Office [BC EAO] 2019a). The Mine footprint is located in the headwaters of the Davidson Creek and Creek 661 watersheds. The Mine footprint includes an approximate area of 4,400 hectares, which accommodates the Mine, mine waste, ore processing, and on-site infrastructure.

New Gold Inc. received a Federal Decision Statement (DS) on April 15, 2019, under the *Canadian Environmental Assessment Act, 2012* (Canadian Environmental Assessment [CEA] Agency 2019), and an Environmental Assessment Certificate (EAC) #M19-01 on June 21, 2019, under the British Columbia 2002 *Environmental Assessment Act* (BC EAO 2019b). In August 2020, Artemis Gold Inc. (Artemis) acquired the mineral tenures, assets, and right in the Blackwater Project, that were previously held by New Gold Inc. The EAC was transferred to Blackwater Gold Ltd. (BW Gold), a wholly owned subsidiary of Artemis, on August 7, 2020, under the 2018 *Environmental Assessment Act* (BC EAO 2020). BW Gold received *Environmental Management Act* (EMA) Permit PE-110602 on June 24, 2021, authorizing early construction works, and Permit PE-110652, authorizing discharge of effluent from the Mine to surface water and groundwater, on May 2, 2023. The Mine's construction phase was initiated in September 2022, with works continuing through 2025. Mining operations commenced on May 1, 2025, with the expected life of the Mine being 23 years.

1.2 Regulatory Requirements and Objectives

In accordance with regulatory approval requirements, long-term aquatic monitoring programs have been implemented for waterbodies in the Mine area to detect and measure changes to aquatic resources and to determine if these changes constitute mine-related effects. Condition 3.14 of the DS required BW Gold to develop a Fish and Fish Habitat Follow-Up Program (FUP) to be implemented during all phases of the Project to verify the accuracy of the environmental assessment (EA) and to assess the efficacy of fish and fish habitat mitigation measures for Davidson Creek. The 'Follow-Up Programs for Condition 3.14 of the Blackwater Gold Decision Statement Issued under Section 54 of the *Canadian Environmental Assessment Act*' (Palmer Environmental Consultants Group Ltd. [Palmer] 2023) was developed to fulfill this condition.

The 'Aquatic Effects Monitoring Program (AEMP) Plan Version 4.0' (ERM & Triton 2025) was developed to address Permit PE-110652 Condition 4.6 and Condition 30 of the EAC #M19-01. The AEMP has been designed to provide information on the aquatic receiving environment and to detect potential Mine-related effects on the AEMP components (physical, chemical, biological).

1.3 Scope of Work

This report summarizes the methods and results of the 2025 Davidson Creek Young-of-Year (YoY) and Juvenile Rainbow Trout (*Oncorhynchus mykiss*; RB) Abundance, and the Fish Community Inventory field programs, conducted by Triton from July to September 2025. These field programs were completed to fulfill yearly monitoring requirements described in the FUP for Condition 3.14 and the AEMP Plan V4.0 (ERM and Triton 2025). Specifically, in relation to Condition 3.14, this field program pertained to sub-condition 3.14.2.1 – community composition. Furthermore, this field program pertains to Section 4.8.1 – Fish Community Inventory and Tissue Metals Sampling of the AEMP Plan.

Young-of-year and juvenile Rainbow Trout abundance surveys were conducted with three-pass depletion electrofishing and an evaluation of habitat characteristics at 10 sites in Davidson Creek. Fish community inventory surveys were conducted with three-pass depletion electrofishing surveys at 10 sites in Davidson Creek, Creek 661, Creek 705, Turtle Creek, and a Fawnie Creek tributary.

1.4 Measurement and Assessment Endpoints

Measurement and assessment endpoints are specified in the FUP for Condition 3.14 (Palmer 2023) and the AEMP Plan V4.0 (ERM and Triton 2025); for ease of reference, endpoints relevant to the YoY and Juvenile Rainbow Trout Abundance and Fish Community Inventory programs are provided in Table 1-1 and Table 1-2, respectively.

The measurement and assessment endpoints of the YoY and Juvenile Rainbow Trout Abundance program consisted of an inventory of the fish community and measurements of fish health and fish habitat. The measurement and assessment endpoints of the Fish Community Inventory program consisted of an inventory of the fish community and fish health measurements.

Table 1-1. FUP for Condition 3.14 measurement and assessment endpoints YoY and juvenile Rainbow Trout

Measurement Endpoint	*Assessment Endpoint*
Fish community and abundance	Catch per unit effort (CPUE), abundance, fish density (fish/100 m^2)
Fish health	Length, weight, condition, age
Fish habitat	Mesohabitat unit boundaries, channel dimensions, stream morphology, cover, vegetation, substrate composition, riparian habitat

Table 1-2. AEMP measurement and assessment endpoints fish community inventory

Measurement Endpoint	*Assessment Endpoint*
Fish inventory	Catch per unit effort (CPUE), abundance, and density (fish/100 m^2) for each identified species
Fish health	Length, weight, condition, age

2.0 Sampling Sites

Sampling of YoY and juvenile Rainbow Trout abundance under the FUP for Condition 3.14 occurred at 10 sampling locations throughout the Davidson Creek mainstem, downstream of the Mine footprint to its confluence with lower Chedakuz Creek. Monitoring of the fish community and sampling of tissue for metals under the AEMP occurred at 11 sampling locations, distributed through Davidson Creek, Creek 661, Creek 705, Turtle Creek, and a Fawnie Creek tributary. Two of the Davidson Creek sites were analogous under both the FUP for Condition 3.14 and the AEMP programs; therefore, sampling only occurred once at these sites.

Specific sampling site locations are provided in Figure 2-1 and Table 2-1. Representative photographs of the sites are included in Appendix 1.

3.0 Methods

3.1 YoY and Juvenile Rainbow Trout Abundance and Fish Community Inventory Sampling

3.1.1 Timing

The FUP for Condition 3.14 YoY and Juvenile Rainbow Trout Abundance electrofishing surveys were conducted over four days in July (DC-1, DC-2, DC-3, and DC-4) and six days in August (DC-5, DC-6, DC-7, DC-8, DC-9, and DC-10). Field work was conducted in July in the four farthest downstream sites (DC-1 to DC-4) to avoid sampling during the Kokanee (*Oncorhynchus nerka*; KO) spawning period in the lower reaches of Davidson Creek. As Kokanee have not been observed in the upper reaches of Davidson Creek, the rest of the field work at the other Davidson Creek sites and the AEMP sites was conducted later in the summer. AEMP Fish Community Inventory electrofishing surveys were conducted over a 10-day period from August 6 to September 16, 2025. Sampling dates are provided in Table 3-1. AEMP sites DC-05 and DC-15 were surveyed in August at the same time as the FUP for Condition 3.14 sampling sites (sites DC-9 and DC-5, respectively) as the sites are analogous.

Notes: *Minnow trapping September 15-17, electrofished on September 17

Following commencement triggers described in the implementation framework in the AEMP Plan V 4.0, the electrofishing surveys were conducted based on the timing where most of the Rainbow Trout fry were predicted to have emerged from the gravels to minimize impacts to developing embryos and YoY. Emergence timing was predicted using instream temperature data to calculate Accumulated Thermal Units (ATUs). Rainbow Trout yolk absorption and emergence from the gravel is expected to occur between 500 and 525 ATUs according to the AEMP Plan (ERM & Triton 2025). Instream temperature data was used to estimate fry emergence based on the date that the last spawning Rainbow Trout migrating upstream was captured during the 2025 Rainbow Trout Spawner program.

The last spawning Rainbow Trout were observed migrating upstream at the DC-1/DC-20 box traps on June 15, 2025. Based on the temperatures from temperature loggers installed at the ST-08 DEEP hydrology station located near DC-1 and DC-2 beginning on June 15, 2025, ATUs had reached between 500 and 525 around July 22, 2025. However, electrofishing was conducted on July 12, 2025. The peak migration for Rainbow Trout was May 18, 2025, therefore most of the eggs would have been deposited in mid to late May. Fry emergence based on the peak spawn date was estimated to be July 7 to 9, 2025, therefore it is likely most of the fry emerged from the gravels prior to electrofishing. Spawning Kokanee were first observed in the lower reaches of Davidson Creek on July 26, 2025, with no Kokanee spawners observed during the July 19 survey, indicating that there was potential for Kokanee to be migrating upstream as the last Rainbow Trout fry would have been predicted to emerge from the gravels this year. Therefore, electrofishing was conducted in mid July to avoid impeding Kokanee migration or disturbing fresh redds.

The final spawning Rainbow Trout at DC-8 was observed on June 16, 2025, and eggs deposited then were predicted to emerge around July 28 or 29, 2025, according to temperature data from the nearby DC-05 temperature logger. Electrofishing surveys from DC-5 to DC-10 were conducted in early August, missing the emergence window. The last spawning Rainbow Trout were observed at TC-15 on June 10, 2025, and those fry were predicted to emerge on July 23, 2025. Electrofishing surveys at the Turtle Creek sites were not conducted until September, missing the emergence window. No temperature data was available for creek 661; however, electrofishing surveys were conducted in September, towards the end of the season.

3.1.2 Field Methods

The YoY and Juvenile Rainbow Trout Abundance and Fish Community Inventory sampling surveys followed similar methodologies. At each site, three-pass depletion electrofishing was conducted over an accessible 100-m linear segment length. The electrofishing sampling approach and effort were consistent at all sites. Sites were the same as those used in previous surveys conducted by Palmer in 2023, which were identified by the presence of flagging. If flagging was missing or difficult to see, new flagging was installed. Most of the sites were 100 m long; however, sites DC-2, DC-6, and DC-7 were shorter by approximately 20 m due to heavy blowdown, large woody debris, or extensive channel braiding restricting access.

Sites were isolated using block nets with the downstream block net installed first, followed by the upstream net. T-posts were used to adequately support the net for the duration of the sampling, and block nets were secured to t-posts with zip-ties. Block nets were sealed to the channel bottom

and against each bank, using sandbags and/or cobbles and boulders, to ensure a closed sampling site. The integrity of block nets was inspected after installation and between each pass. Necessary modifications or repairs were completed prior to each subsequent pass. Crews did not wade through the electrofishing site prior to sampling and between subsequent passes to minimize instream disturbance.

In situ water quality measurements were collected prior to electrofishing. Suitable electrofisher settings were selected based on water temperature and conductivity. In situ water quality measurements (temperature in degrees Celsius [°C], dissolved oxygen [DO] in milligrams per litre [mg/L] and percent [%], pH, specific conductivity in microsiemens per centimetre [µS/cm], and turbidity in nephelometric turbidity units [NTU]) were collected using a YSI ProQuatro multiparameter meter and a LaMotte turbidity meter.

Sampling sites were electrofished with a Smith-Root Model LR-24 backpack electrofishing unit from downstream to upstream, in a repeatable zig-zag pattern targeting habitat features such as large woody debris and undercut banks. Sampling effort (electrofishing seconds [s]), electrofisher settings, and wading pace were approximately the same for each pass. Three passes of each sampling site were conducted. Additional passes were completed when required to achieve depletion. Electrofisher settings (voltage [V], frequency in Hertz [Hz], pulse width in milliseconds [ms]) and sampling effort were recorded following each electrofishing pass. Fish were processed following each pass and subsequently released outside of the enclosed sample site, excluding those that were euthanized for tissue metal sampling.

All captured fish were identified to species level, enumerated, and measured for fork length (to the nearest millimetre [mm]) and weight (to the nearest 0.1 gram [g]). Each fish was classified in the field by life stage (i.e., YoY, juvenile, or adult) based on length, presence/absence of yolk sacs, and presence/absence of milt or roe. Each fish was visually examined for the presence of deformities, erosion, lesions, and tumors (DELTs), and for the presence of previous marks (e.g., adipose or fin clips). Representative photos were taken of each size class of Rainbow Trout captured; a selection of photographs is provided in Appendix 1.

At the AEMP Fish Community Inventory sites, whole body tissue samples were collected for metals analysis with a target sample size of eight Rainbow Trout per site. Fish euthanized for tissue metals analysis were dissected and gonad development was internally examined to determine sex and confirm sexual maturity. Tissue samples were kept on ice in the field and then frozen prior to being shipped to ALS laboratories on September 29, 2025.

During the FUP for Condition 3.14 YoY and Juvenile Rainbow Trout Assessment surveys, scale samples were collected from a subset of 30 fish per size class (grouped for all sites), excluding YoY less than 80 mm in fork length. During AEMP fish community inventory surveys, scale samples were collected from a subset of fish, targeting 10 fish per age class greater than 80 mm at each site (Table 3-2).

Table 3-2. Approximate fish age by size

Age	*Fish Fork Length (mm)*	*Collected Scales*
0+	<80	No
1+	81-125	Yes
2+	126-200	Yes
3+	201-275	Yes
4+	276-350	Yes
5+	351-400	Yes
6+	401-450	Yes

Scales were collected from the left side of the fish between the posterior edge of the dorsal fin and the lateral line, approximately two scale rows above the lateral line. At least 10 scales were collected from each fish. Collected scales were placed into scale envelopes (i.e., coin envelopes) clearly labelled with site name, date, fish ID, species, length, and weight. Otoliths were extracted for age analysis from fish euthanized for tissue metal sampling and opportunistically from other mortalities. Otoliths were placed in 1.5-mL plastic vials to prevent breakage. The vials were then placed in clearly labeled envelopes, which were left open to allow the otoliths to dry thoroughly. Otoliths and scale samples were shipped on September 29, 2025, to North/South Consultants in Winnipeg, Manitoba for age analysis.

Following completion of the electrofishing passes, channel measurements (channel width [m], wetted width [m], gradient [%]) were recorded at multiple locations throughout the sampling site and site photographs were taken. Upon completion of sampling, isolation block nets, t-posts, and sandbags were removed from the watercourse.

3.1.2.1 TC-05 Sampling

Due to beaver dam impoundment and water depths over 1.5 m at TC-05, multi-pass electrofishing surveys were not conducted. Reconnaissance efforts, conducted over two days in June 2025 were made to find an alternative survey site near the existing TC-05. No suitable 100-m section of channel for electrofishing surveys was found. Instead, Gee minnow traps were deployed to capture fish for tissue metals analysis.

The minnow traps were set in three different groups as the area was separated by multiple dams that prevented fish passage at low flows. Five traps were set in two of the sections, and eight traps were set in another, for a total of 18 traps. In situ water quality measurements were collected using a YSI ProQuatro multiparameter meter and a LaMotte turbidity meter prior to setting traps. Trap depth was recorded to ensure sufficient depth to avoid stranding, and soak time was recorded to calculate effort. Traps were checked daily and baited with dry cat food. After two days and only a single fish capture, the crew electrofished along the edges of the beaver dam impounded areas, where accessible, to collect fish for tissue metals analysis.

3.1.3 Laboratory Methods

Age analysis was conducted by North/South Consultants Ltd. in Winnipeg, Manitoba. Scales were removed from the envelopes and sorted under a dissecting microscope to remove any

regenerated scales. Three or four of the best representative scales were pressed between two glass slides and viewed under a dissecting microscope with reflected light. Light intensity, magnification, and angle of the scale were adjusted throughout the viewing process.

Otoliths were focus sectioned and set in Cold Cure epoxy to harden for 48 hours. Using a Struers Minitom low speed sectioning saw, the otolith was sectioned on either side of the nucleus leaving the nucleus in the section. The section was then permanently mounted on a microscope slide with Cytoseal-60 and viewed under a microscope with transmitted light.

All otoliths and scales were read by an experienced ageing technician, with structures rated on quality based on the confidence index as follows:

- Very good – annuli are clear with no interpretation problems.
- Good – annuli are clear with few easy interpretation problems.
- Fair – annuli are fairly clear with some areas presenting easy and moderate interpretation problems.
- Poor – annuli are fairly unclear presenting a number of difficult interpretation problems.
- Very Poor – annuli are very unclear presenting significant interpretation problems.

3.1.4 Quality Assurance/Quality Control

Water quality meters were calibrated each morning prior to use. Calibration solutions for conductivity (1,413 µS/cm) and pH (4.01, 7.01, and 10.01 pH) were used to calibrate the YSI ProQuatro multiparameter meters. The DO sensor was calibrated in the field prior to use; membranes and fluid were replaced when required. Lamotte turbidity meters were calibrated with solution (1, 10, or 100 NTU) in the expected turbidity range of the watercourse.

Field crews were experienced and knowledgeable of fish species present in the local watersheds. A subset of captured fish was photographed for species identification verification. Field data, photographs, and mapping information collected on digital platforms were examined for completeness prior to being uploaded nightly to cloud servers to mitigate the risk of data loss.

North/South Consultants Ltd. completed quality control and quality assurance for age structures, which was conducted independently by an alternate ageing technician on a randomly selected subset (10%) of otoliths. If 90% agreement was not achieved with regard to age, all structures were re-analyzed using a three-reader consensus approach.

3.1.5 Data Analysis

Adipose fin clips were used to identify fish that had been previously relocated from upstream watercourses within the Mine footprint. All fish captured with adipose clips were excluded from calculations of assessment endpoints.

3.1.5.1 Catch Per Unit Effort (CPUE)

Catch per unit effort (CPUE) was calculated as the number of fish per 100 seconds (s) of electrofishing effort for each electrofishing pass using the following equation:

$$CPUE = number\ of\ fish\ caught/(\frac{electrofishing\ effort}{100})$$

CPUE is an index of relative abundance that can be used to compare the abundance of fish populations over time with the assumption that catch is proportional to the amount of effort.

3.1.5.2 Abundance and Density

Fish capture data were used to estimate the abundance and density for the total fish community (all species), and YoY and juvenile life stages of Rainbow Trout.

Abundance was estimated with the Carle-Strub maximum likelihood estimation (MLE) method from removal data (Carle and Strub 1978). This method estimates the true fish abundance (*N*) in a closed site using sequential removal data (e.g., 3-pass electrofishing), while avoiding bias and unreliable estimates common with earlier methods. The Carle–Strub likelihood estimate was calculated using the Fisheries Stock Assessment R Package (Ogle et al. 2025; R Core Team 2025).

Two assumptions must be met to use the Carle-Strub model to estimate abundance from removal data: the population size changes only from capture during sampling (i.e., sampling is from a closed population); and capture probabilities are equal among passes. The assumption of closed population was achieved through isolation via block nets of survey sites, as described in section 3.1.2. The assumption of equal probability of capture among passes was tested using a goodness-of-fit (GoF) model and a Chi squared (χ^2) test.

Fish density was calculated as the number of fish per square metre (fish/100 m^2) based on the abundance estimate and the area sampled at each site. The Carle–Strub MLE provides likelihood-based confidence limits. Standard error (SE) and 95% confidence intervals (CI) were calculated for both abundance and density estimates.

3.1.5.3 Population Structure – Length and Weight

Prior to conducting analyses with weight and length data, these data were screened for errors and outliers. Rainbow Trout length and weight data were plotted to allow for visual identification of outliers. Outliers were either removed from the data set if they were obvious errors, repaired if the error could be identified, or included in the analyses if the outlier value was possibly a true value.

Population structures of Rainbow Trout were assessed by comparing length frequency distributions, weight frequency distributions, and length-weight regressions. Frequency distributions were developed based on the fork length (mm) and weight (g) measurements collected from all captured Rainbow Trout (adipose fin-clipped fish excluded). A log-transformed weight-length linear regression was generated to display the relationship between the two measures.

The length frequency distributions between the AEMP impact stream sites and the control sites were compared using a two-level Kolmogorov-Smirnov test. Five individual length measurements were considered the minimum sample size for the Kolmogorov-Smirnov test.

3.1.5.4 Population Structure – Length and Age

Length-age regressions of Rainbow Trout were developed for all sites and were used to estimate growth rates. A Von Bertalanffy (VB) model was not successful in estimating growth rates due to a small number of age classes observed. The growth rates of Rainbow trout from the AEMP impact sites were compared to those of the control sites by analysis of covariance (ANCOVA). Sites were pooled among watersheds for the comparison of impact sites to control sites. Not all sites sampled in Davidson Creek under the FUP for Condition 3.14 had sufficient sample sizes of age structures to be included in the analysis. Assumptions of normality and homogeneity of variance were tested using Shapiro-Wilk and Levene's tests. Site-specific growth rates were determined using the slope of the length-age relationships. The interaction of regression slopes of the length-age relationship was tested among sites prior to conducting the ANCOVA. ANCOVA can only proceed if the slopes among the sites are parallel to one another. Non-parallel slopes can indicate that the grow rate among sites is different. Finally, Tukey adjusted pairwise comparisons were used to determine differences in growth rates between sample sites.

3.1.5.5 Condition

Condition indices provide a comparative measure of the plumpness of fish. Two condition indices were used for this program: Relative condition (K_n) and Fulton's condition factor (K). Both indices make use of the weight (g) and length (mm) of individual fish.

Relative condition (K_n) was as calculated by comparing the measured fish weight (W) to the expected fish weight (W_E) as follows:

$$\boldsymbol{K_n = \frac{W}{W_E}}$$

The expected fish weight (W_E) was calculated from the length and weight data from reference sites and from historical data (AMEC 2013a, 2013b), as described in the FUP for Condition 3.14 report (Palmer 2023).

Fulton's condition factor is widely use in fisheries and general fish biology studies (Fulton 1902; Fulton 1904; Nash et al. 2006; Ricker 1975). Fulton's condition factor was calculated according to the following equation:

$$\boldsymbol{K = 100{,}000 \times \frac{W}{L^3}}$$

Both relative and Fulton's conditions were compared among Davidson Creek sites. AEMP sites were compared for Fulton's condition only. First, the distributions were tested for normality using an Anderson-Darling test. If the data were normally distributed, a single factor analysis of variance (ANOVA) followed by a Tukey's multiple comparison test was computed to compare the

respective condition among sites. If the data were not normally distributed, a Kruskal-Wallis test by ranks was conducted with a Steel-Dwass test for multiple comparisons. Statistical significance was assumed if $p < 0.05$.

3.2 Fish Habitat Assessment Procedures

3.2.1 Timing and Field Methods

Detailed fish habitat data were collected at sites DC-1 through DC-10 following the Level 1 methodologies of the Fish Habitat Assessment Procedures (FHAP) developed by Johnston and Slaney (1996). Level 1 FHAP surveys were conducted at DC-1 and DC-2 prior to the Kokanee spawning period in Davidson Creek. The remaining FHAP surveys were completed later in the summer as Kokanee have not been observed upstream of a large beaver dam, located between DC-2 and DC-3, that acts as a barrier to Kokanee passage (Table 3-3).

Table 3-3. Davidson Creek FHAP 2025 Survey Dates

Site	*FHAP Survey Date*
DC-1	July 17
DC-2	July 18
DC-3	August 20
DC-4	August 21
DC-5/DC-15	August 27
DC-6	August 27
DC-7	September 18
DC-8	September 18
DC-9/DC-05	September 17
DC-10	September 17

The stream sections were classified into five distinct naturally-occurring habitat units (cascades, glides, pools, riffles, and other). The following information was collected at every third habitat unit encountered: length, bankfull and wetted widths, depths (residual pool depths, riffle crest depths), bed material, and percentage of cover types. Surveys were conducted in an upstream direction with extents of each habitat unit recorded using an EOS Arrow 100 Global Positioning System (GPS) to improve location accuracy. Discharge measurements were collected at the start of each survey using a Swoffer.

3.2.2 Quality Assurance/Quality Control

FHAP surveys were conducted by a combination of the same field crew members to maintain consistency across all sites. Field data, photographs, and mapping information collected on digital platforms were examined for completeness prior to being uploaded nightly to cloud servers to mitigate the risk of data loss.

3.2.3 Data Analysis

3.2.3.1 Mesohabitat Relative Abundance

The relative abundance of each habitat unit (riffle, run, pool, cascade, and other) at each survey site was determined by dividing the number of each habitat unit by the total number of all habitat units and then multiplying by 100%. Any habitat units designated as Category 2 (off-channel habitat, areas split by islands, or other significant braids) were all grouped with main channel habitat (Category 1) in the relative abundance calculations to demonstrate the availability of each habitat type for fish regardless of location in the channel.

4.0 Results

4.1 Field Program

4.1.1 YoY and Juvenile Rainbow Trout

Four fish species were captured in Davidson Creek (Table 4-1). A total of 2,088 Rainbow Trout were captured among the ten sites (96 Rainbow Trout were excluded from analysis due to the presence of adipose clips, indicating fish that had recently been relocated during nearby fish salvage efforts and were considered non-residents). Non-Rainbow Trout species were only captured at the DC-1 and DC-2 sites, closest to the confluence with lower Chedakuz Creek. Eight Longnose Dace (*Rhinichthys cataractae*; LNC) were captured at DC-1 along with one Prickly Sculpin (*Cottus asper*; CAS). Four Kokanee fry were captured at DC-2.

Table 4-1. Fish species captured in Davidson Creek, 2025

Common Name	*Scientific Name*	*Fish Species Code*	*Sites Captured*
Rainbow Trout	*Oncorhynchus mykiss*	RB	All
Kokanee	*Oncorhynchus nerka*	KO	DC-2
Longnose Dace	*Rhinichthys cataractae*	LNC	DC-1
Prickly Sculpin	*Cottus asper*	CAS	DC-1

A total of 155 fish mortalities occurred during sampling, including 85 juvenile Rainbow Trout (4 with adipose fin clips) and 70 Rainbow Trout fry. Site specific mortality numbers and causes are provided in Table 4-2. Throughout the sites, most of the mortalities were due to electrofishing injury. Fish sampled for tissue metals were first taken from existing mortalities prior to additional fish being euthanized.

There were a total of 59 mortalities at DC-9/DC-05 during sampling. There were 26 mortalities due to electrofishing injury, and 33 mortalities during processing. This was due to compounding factors such as low dissolved oxygen levels, crowding in holding buckets, increasing temperatures during processing, and presence of clove oil residue in one of the holding buckets. Despite efforts to maintain water quality (battery operated aerators, swapping water in holding buckets, multiple releases, and additional personnel called to assist to reduce holding times), there were more mortalities at this site than others.

4.1.2 Fish Community Inventory

A total of 1,838 Rainbow Trout were captured in the AEMP streams (93 were excluded from further analysis due to the presence of adipose fin clips). No other species were captured. In addition to the mortalities at DC-5/DC-15 and DC-9/DC-05 mentioned in section 4.1.1, there were 100 additional mortalities at the AEMP sites, 50 of which were fish euthanized for tissue metal samples. Site specific mortality numbers and causes can be found in Table 4-3. Most of the mortalities were due to electrofishing injury or euthanization for fish tissue metals.

Table 4-2. Fish mortalities by site, life stage, and cause in Davidson Creek

Site	*Life Stage*	*Cause and Number of Mortalities*				
		Electrofishing Injury	*Capture Trauma*	*Handling Trauma*	*Euthanized – Tissue Metals*	*Total*
DC-1	Fry	13	0	0	0	21
	Juvenile	8	0	0	0	
DC-2	Fry	11	2	0	0	17
	Juvenile	4	0	0	0	
DC-3	Fry	0	0	0	0	3
	Juvenile	3	0	0	0	
DC-4	Fry	0	0	0	0	5
	Juvenile	5	0	0	0	
DC-5/DC-15	Fry	11	0	0	0	19
	Juvenile	3	0	0	5	
DC-6	Fry	3	0	0	0	5
	Juvenile	2	0	0	0	
DC-7	Fry	8	0	0	0	10
	Juvenile	2	0	0	0	
DC-8	Fry	8	1	0	0	12
	Juvenile	0	0	0	0	
DC-9/DC-05	Fry	9	0	0	0	59
	Juvenile	17	0	33	0	
DC-10	Fry	1	0	0	0	4
	Juvenile	2	1	0	0	

Note: Sites DC-5/DC-15 and DC-9/DC-05 are analogous under the FUP for Condition 3.14 and the AEMP and are reported once in this table.

Table 4-3. Mortalities in AEMP streams by site, life stage, and cause

Site	Life Stage	Number of Mortalities				
		Electrofishing Injury	Capture Trauma	Handling Trauma	Euthanized – Tissue Metals	Total
661-05	Fry	0	0	0	0	7
	Juvenile	0	0	0	5	
	Adult	0	0	0	2	
661-10	Fry	0	0	0	0	8
	Juvenile	0	0	0	8	
	Adult	0	0	0	0	
705-05	Fry	3	0	0	0	11
	Juvenile	0	0	0	8	
	Adult	0	0	0	0	
705-10	Fry	18	0	0	0	26
	Juvenile	0	0	0	8	
	Adult	0	0	0	0	
FC-01	Fry	25	1	1	0	37
	Juvenile	2	0	0	8	
	Adult	0	0	0	0	
TC-05	Fry	0	0	0	0	3
	Juvenile	0	0	0	0	
	Adult	0	0	0	3	
TC-10	Fry	0	0	0	0	8
	Juvenile	0	0	0	8	
	Adult	0	0	0	0	

The electrofishing sampling location at site 705-05 was moved downstream due to beaver dam impoundment at the upstream extent, making the area too deep to electrofish. The beaver dam location was used as the new upstream extent of the survey. The crew confirmed in the field that the new survey length was 100 m using a rangefinder and adjusted the flagging tape for future surveys.

No fish were captured at TC-01 as the area was heavily impounded by beaver dams, and the water had flooded beyond the confines of the main channel throughout the valley bottom. There was no obvious dam observed beyond the downstream extent; however, there was evidence of recent beaver activity. The main channel was sampled with the crew electrofishing from the flooded banks. No fish were observed in the area, and the dissolved oxygen was very low (2.99 mg/L).

Electrofishing surveys were not conducted in the mainstem of TC-05 due to beaver dam impoundment raising the water levels too high to safely electrofish. Minnow traps were placed throughout the site to capture fish for tissue samples for metals analysis; only one fish was captured. The crew then electrofished some relatively shallow areas to capture more fish for tissue samples; however, most of the mainstem was too deep to electrofish and the site could not be isolated.

Extra electrofishing effort was undertaken at 661-01 and 661-05 to try to capture the target number of fish for the tissue metal analysis, as no fish were captured in 661-01 and only four fish were captured at 661-05 during the three-pass depletion electrofishing survey. No fish were captured at 661-01 despite the additional effort downstream and upstream of the sampling site.

4.2 Catch Per Unit Effort (CPUE)

4.2.1 YoY and Juvenile Rainbow Trout

CPUE was calculated for Rainbow Trout captured in each electrofishing pass, and for each site (DC-1 to DC-10). The CPUEs for Rainbow Trout are provided in Table 4-4, and the CPUEs for other fish species are provided in Table 4-5. Site CPUE for Rainbow Trout (Figure 4-1) ranged from 2.53 fish/100 s (DC-4) to 10.17 fish/100 s (DC-9). Site CPUE for species other than Rainbow Trout are shown in Figure 4-2. Site CPUE for Longnose Dace and Prickly Sculpin at DC-1 was 0.15 fish/100 s and 0.02 fish/100 s, respectively. CPUE for Kokanee at DC-2 was 0.10 fish/100 s.

Table 4-4. Sampling effort, total unmarked Rainbow Trout captured, and CPUE for Davidson Creek, 2025

4.2.2 AEMP Fish Community Inventory

The CPUEs for Rainbow Trout, which was the only species caught at the AEMP sites, are provided in Table 4-6. Site-specific CPUE (Figure 4-3) ranged from 0 fish/100 s (661-01 and TC-01) to 10.17 fish/100 s (DC-05).

4.3 Abundance and Density

The assumptions that support the Carle-Strub assessment were met during both the YoY and Juvenile Rainbow Trout and Fish Community Inventory Assessments. The assumption of closed populations was met because survey sites were closed with block nets. The assumption of an equal probability of capture among passes was met at all sites, except for DC-9/DC-05., as the probability of captures among passes was not significantly different ($p > 0.05$). The significant difference at DC-9/DC-05 ($p = 0.012$) is likely due to the exclusion of adipose clipped fish from analysis. If the clipped fish are included in the capture probability, there is no significant difference in capture probability between passes ($p = 0.064$). Statistical results are provided in Table 1 of Appendix 4.

Capture probabilities, standard error, and 95% confidence intervals are displayed in Table 4-7. Capture probability at the 661-05 site has a large standard error due to a small sample size ($n = 4$). Any analyses using this capture probability in future years should account for this large confidence interval.

4.3.1 YoY and Juvenile Rainbow Trout Assessment Program

Abundance estimates for Rainbow Trout ranged from 104 (DC-4) to 579 (DC-9) fish per site (Figure 4-4). Total fish density for Rainbow Trout ranged from 21.6 fish/100 m^2 (DC-4) to 117.0 fish/ 100 m^2 (DC-9) (Figure 4-5). Abundance estimates and density of fish species excluding Rainbow Trout

were not calculated, since very few fish of other species were captured. Abundance estimates and fish density per life stage for Rainbow Trout and the total for each site are displayed in Table 4-8.

DC-1 and DC-2 were the only sites where adult Rainbow Trout were captured. Abundance and density estimates of fish from DC-1 through to DC-4 may have been influenced by large beaver dam located between the DC-2 and DC-3 sites. This 2 m tall dam may have limited the movement of smaller fish among these stations. Rainbow Trout fry were not captured at DC-3 and DC-4, suggesting that few Rainbow Trout spawned in these areas in the spring. DC-9 had the greatest abundance and density of fish relative to other sites. This may be due to an upstream fish passage barrier (drop structure) and large fish exclusion fence installed just upstream of the DC-9 site during fish salvage and site preparation works associated with the construction of the Freshwater Reservoir. Fish may have been holding in the DC-9 site as they attempted to migrate upstream beyond the fish exclusion fence.

4.3.2 AEMP Fish Community Inventory Program

Abundance estimates for Rainbow Trout ranged from 4 (661-05) to 671 (FC-01) fish per site (Figure 4-6). Total fish density for Rainbow Trout ranged from 0.7 fish/100 m^2 (661-05) to 192.2 fish/100 m^2 (705-10) (Figure 4-7). Abundance estimates and fish density per life stage are reported in Table 4-9.

Both FC-01 and 705-10 had far more fry than juveniles captured, indicating that Rainbow Trout are spawning near these areas. No fry were observed at 665-05, and only four fish were captured, resulting in a very low density of fish. The only adult Rainbow Trout captured at the AEMP sites was observed at 665-05, a small mature male. Very few fish, and no fry, were captured at TC-10, suggesting that spawning and rearing habitat in this area is limited.

4.4 Population Structure

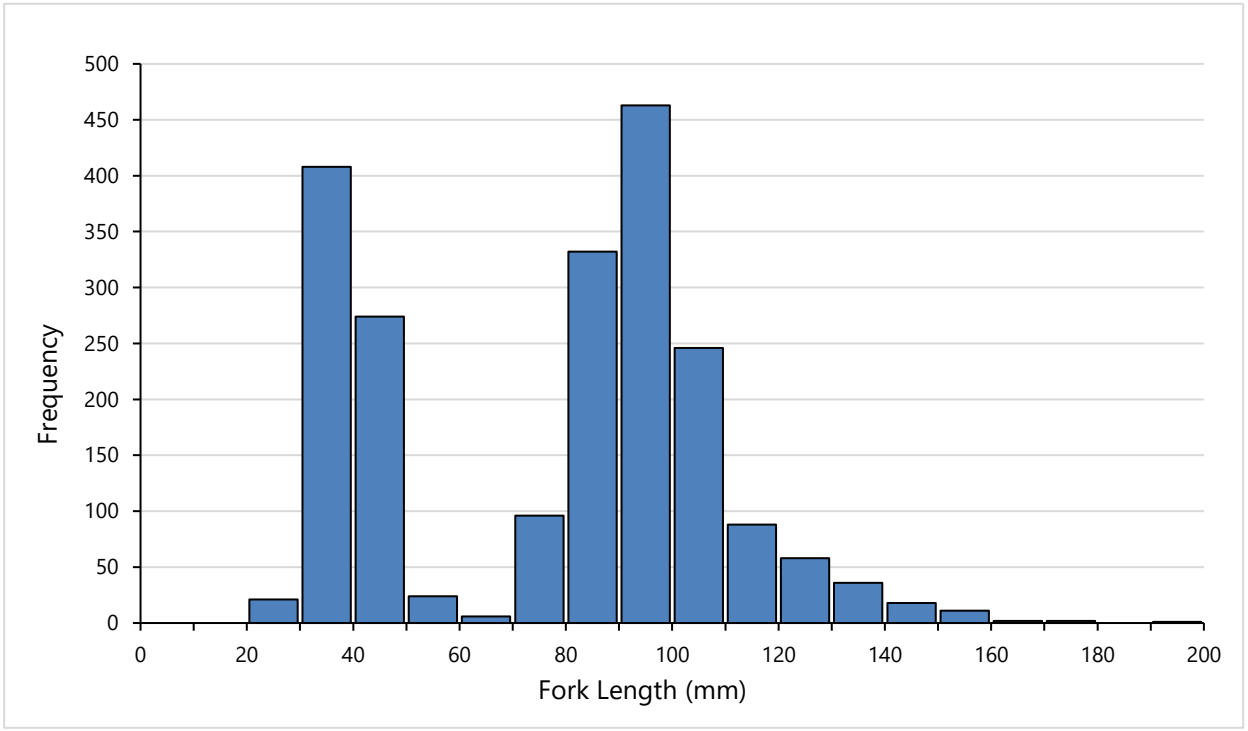
4.4.1 YoY and Juvenile Rainbow Trout Length and Weight

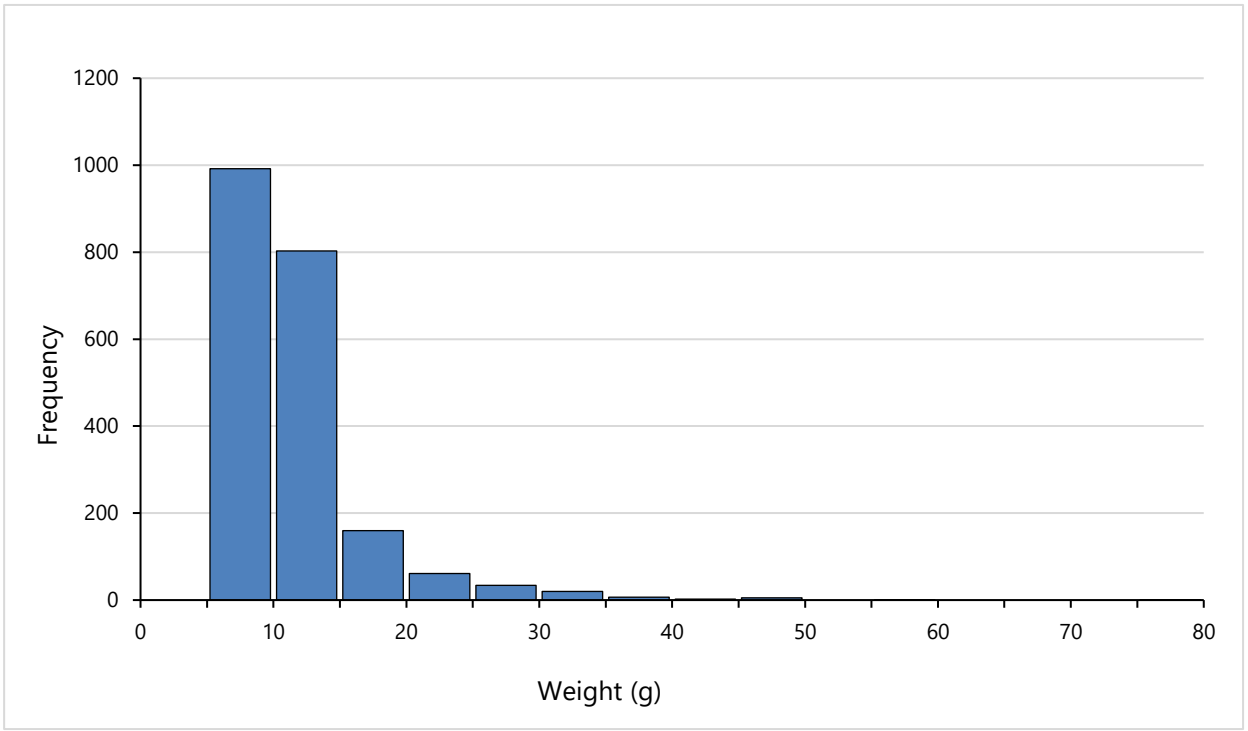
The fork length and weight frequency distributions for Rainbow Trout captured in Davidson Creek are displayed in Figure 4-8. Fork length ranged from 18 mm to 310 mm across all life stages, and weight ranged from 0.1 g to 181 g. One 310 mm long Rainbow Trout was too heavy to weigh with the available field scale and was excluded from the weight frequency distribution and the length-weight regression.

There was a statistically significant difference in length frequency distribution between most of the Davidson Creek sites, p-values can be found in Table 2 of Appendix 4. Most of the fish were between 30-50 mm (fry), or 80-110 mm (juveniles), with few fish weighing over 15 g (Figure 4-8).

The weight-length linear regression, along with the regression equation and coefficient of determination (R^2) is shown in Table 4-9. No potential outliers were observed in the log-transformed weight-length linear regression graph.

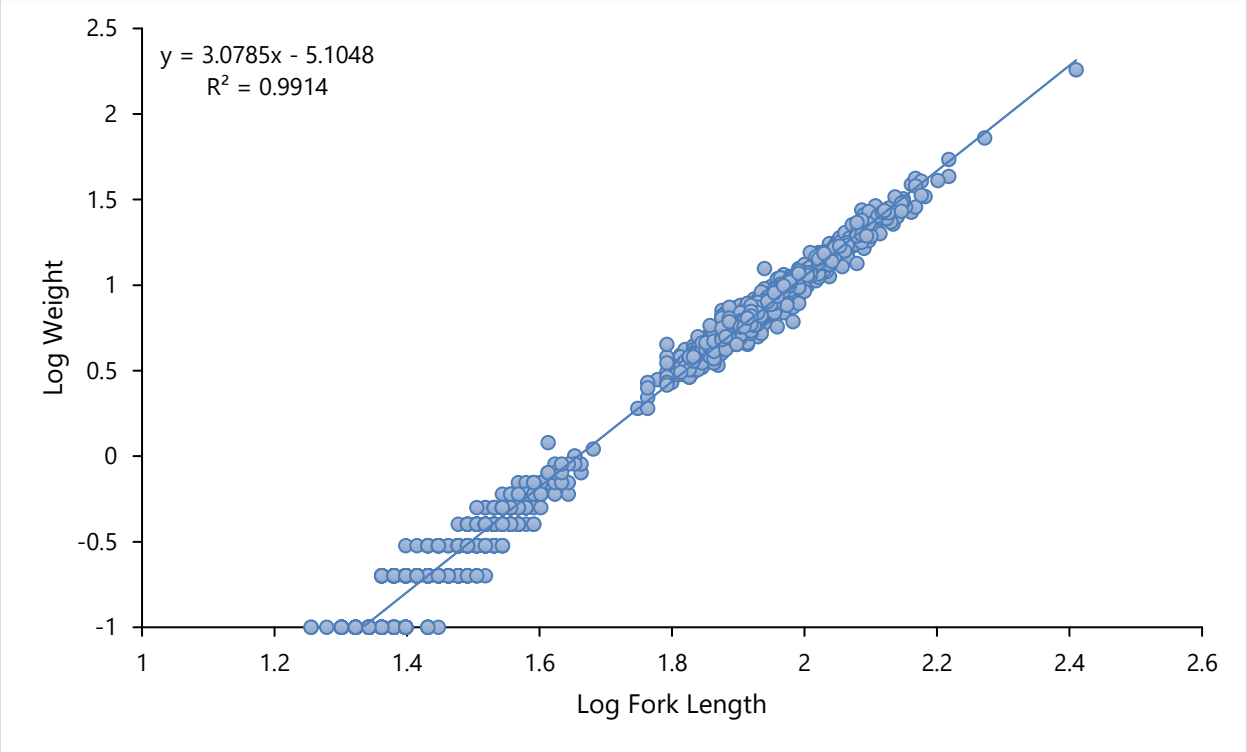
Figure 4-8. Fork length and weight frequency distribution for all Rainbow Trout captured in Davidson Creek, 2025





Note: One fish measuring 257 mm long and weight 181.0 g and another fish measuring 310 mm long and not weighed in the field were not included in the figures, as explained above.

Figure 4-9. Length-weight linear regression for Rainbow Trout captured in Davidson Creek, 2025

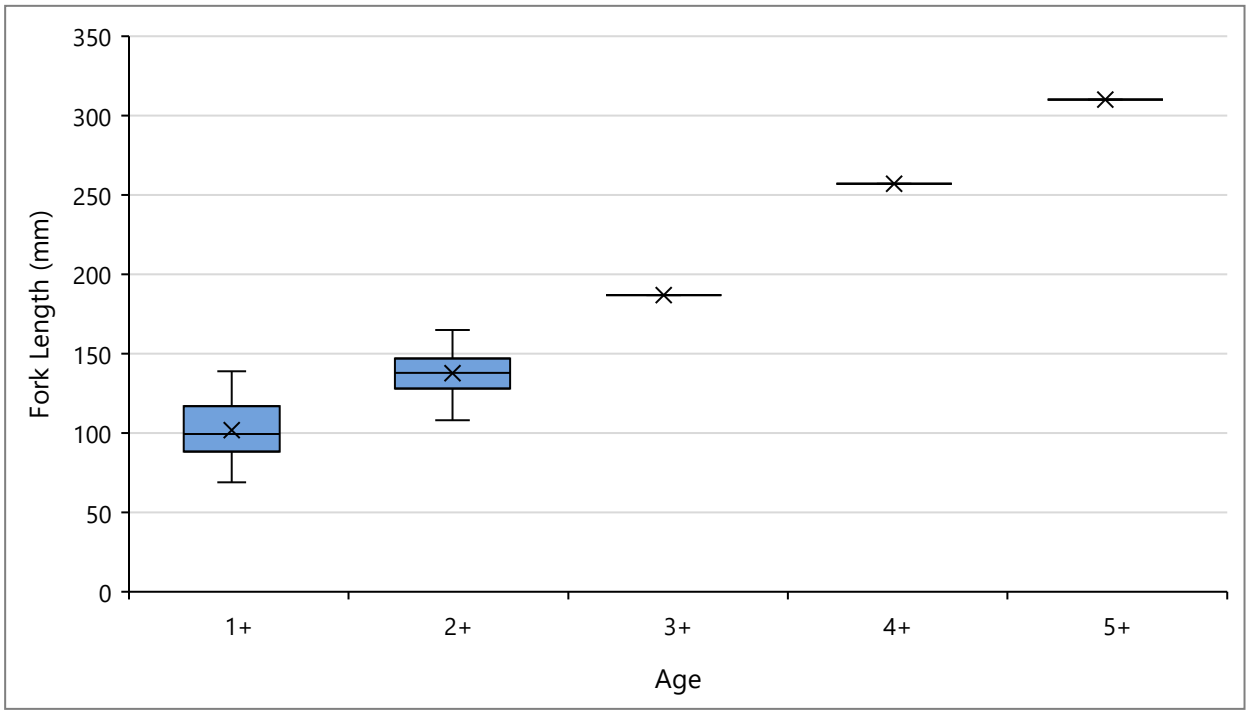


4.4.2 YoY and Juvenile Rainbow Trout Length and Age

The mean length of juvenile Rainbow Trout in Davidson Creek at age 1+ was 101.9 mm, and the mean length at age 2+ was 137.8 mm. One fish was age 3+ (187 mm), one fish was 4+ (257 mm), and one fish was 5+ (310 mm). One fish was not aged, measuring 147 mm. The distribution of length by age category is shown in Figure 4-10. A linear model of a log-length-age regression is shown in Figure 4-11.

The comparison of regression slopes by ANCOVA found that the growth rates were different among some sites. The growth rates for each site are presented in Table 4-10. Sites DC-4, DC-6, DC-8, and DC-10 had too few fish sampled for aging structures to include in the analysis. The Tukey adjusted pairwise comparisons found that the growth rate of fish captured at DC-9 was significantly smaller than the growth rates of fish captured at DC-1 and DC-2. Growth rates at all other sites were not statistically different from one another. The results of the comparisons made are shown in Tables 3 and of Appendix 4.

Figure 4-10. Fork length distribution by age category for Rainbow Trout in Davidson Creek. 2025



Note: Maximum and minimum length indicated by the error bars; x denotes the mean, the 25 to 75 percentile are indicated by the edge of the shaded boxes, the line through the box denotes the median

DC-7	0.81	0.24	0.34	1.28
DC-9	0.29	0.07	0.16	0.43

Note: NA represents a negative LCI

4.4.3 AEMP Fish Community Inventory Length and Weight

The fork length frequency distribution and weight distribution for all Rainbow Trout captured in the AEMP stream sites are shown in Figure 4-12. Fork length ranged from 24 mm to 171 mm, and weight ranged from 0.1 g to 65.2 g amongst fish in the AEMP sites. The weight-length linear regression for Rainbow Trout captured in the AEMP stream sites is shown in Figure 4-13. No potential outliers were noted in the log-transformed length-weight linear regression graph.

The length frequency distributions from the AEMP impact stream sites were compared to those from the control sites. Three comparisons were made: a)the Davidson Creek impact sites (DC-05 and DC-15) were pooled and compared to the pooled regional control sites (705-05, 705-10, and FC-01); b) sites 661-05 and 661-10 were pooled and compared to the pooled regional control sites, as there were no fish captured at the Creek 661 control site in 2025 (661-01); and c) TC-10 (the only Turtle Creek site where fish were captured) was compared to the regional controls. TC-05 was excluded from this analysis as multi-pass electrofishing in a closed system was not conducted. Length frequency distributions of regional controls and impact sites are shown in Figure 4-14

Significant differences in length frequency distributions were found in all comparisons. The regional control sites had a greater number of small fish (i.e., less than 40 mm) than the impact sites. The Davidson Creek impact sites had a larger proportion of large fish (i.e., greater than 70 mm) compared to the control sites. Creek 661 impact sites had a larger proportion of large fish (i.e., greater than 60 mm) than the regional control sites. TC-10 had no fish below 90 mm, with a larger proportion of large fish than the regional control sites. Results of length frequency distribution comparisons are provided in Table 5 of Appendix 4.

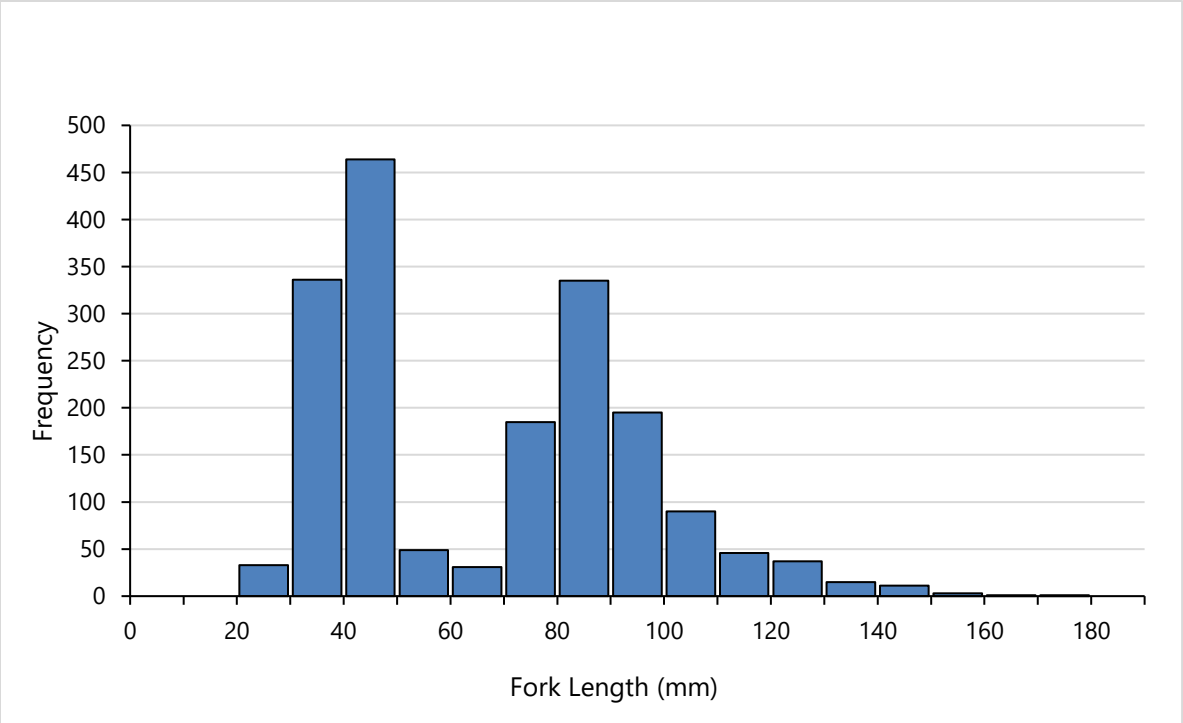

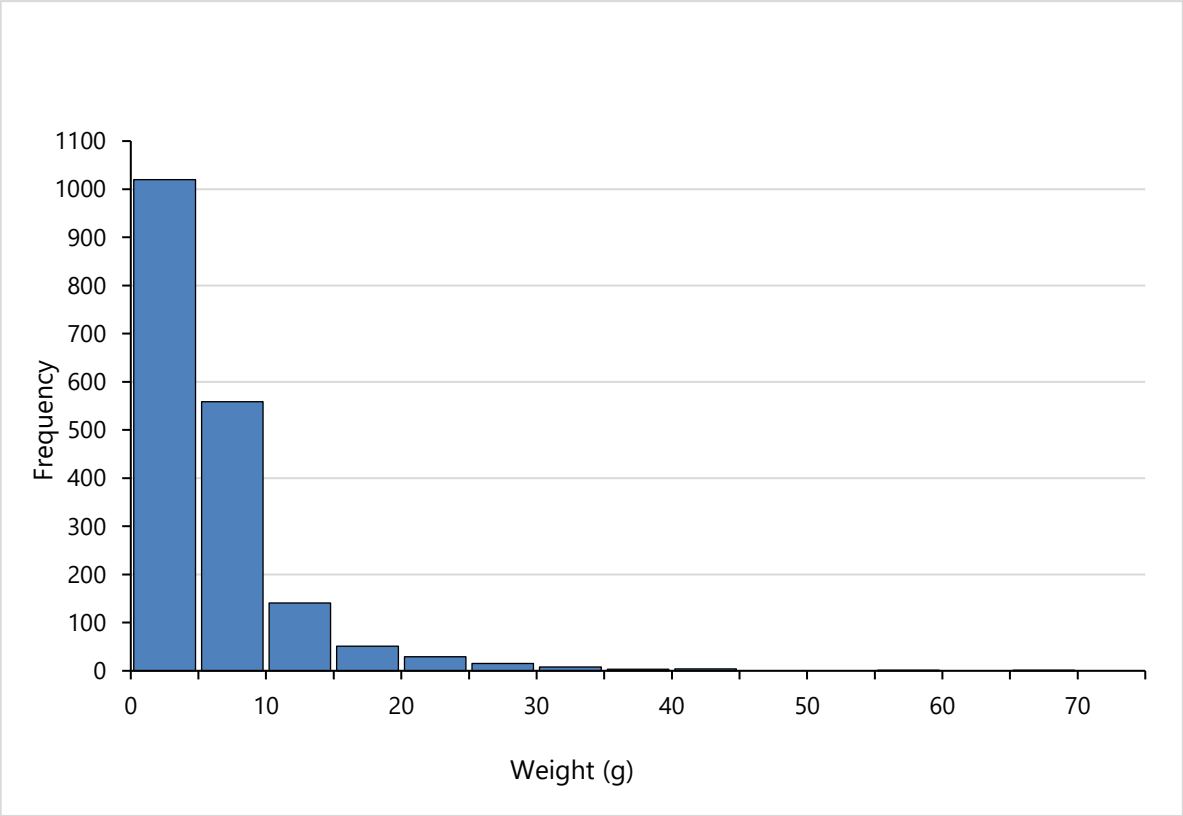

Figure 4-13. Fork length weight linear regression for Rainbow Trout captured in AEMP streams, 2025

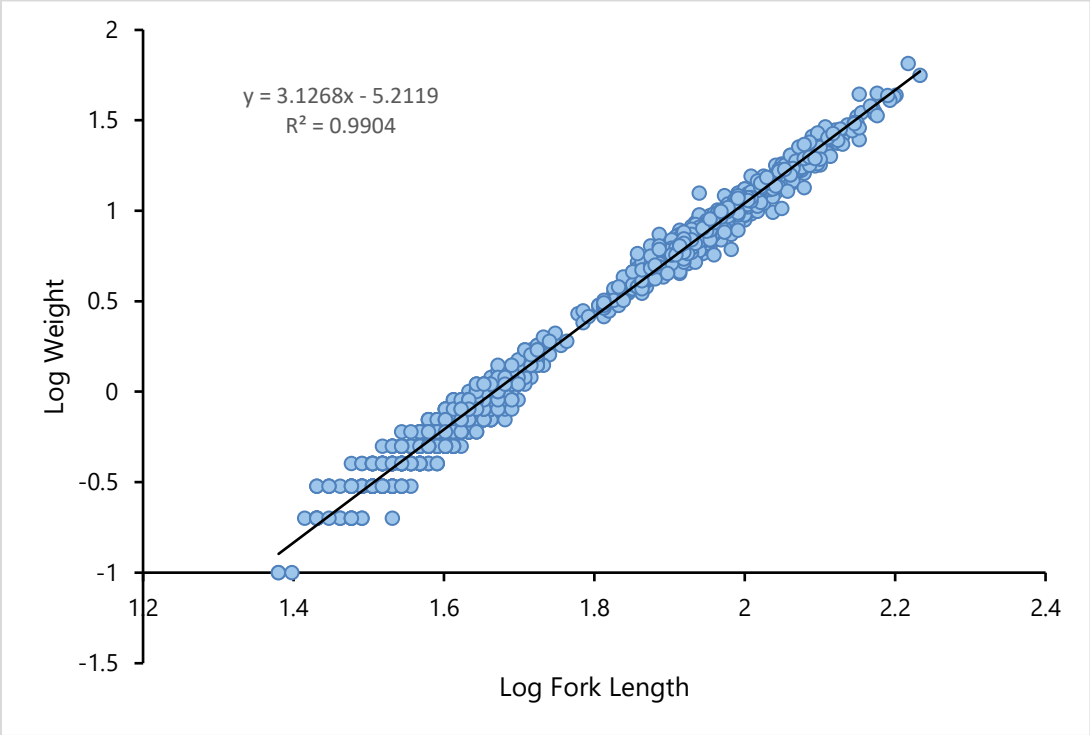

Figure 4-14. Fork length frequency distributions in the AEMP control and impact stream sites, 2025

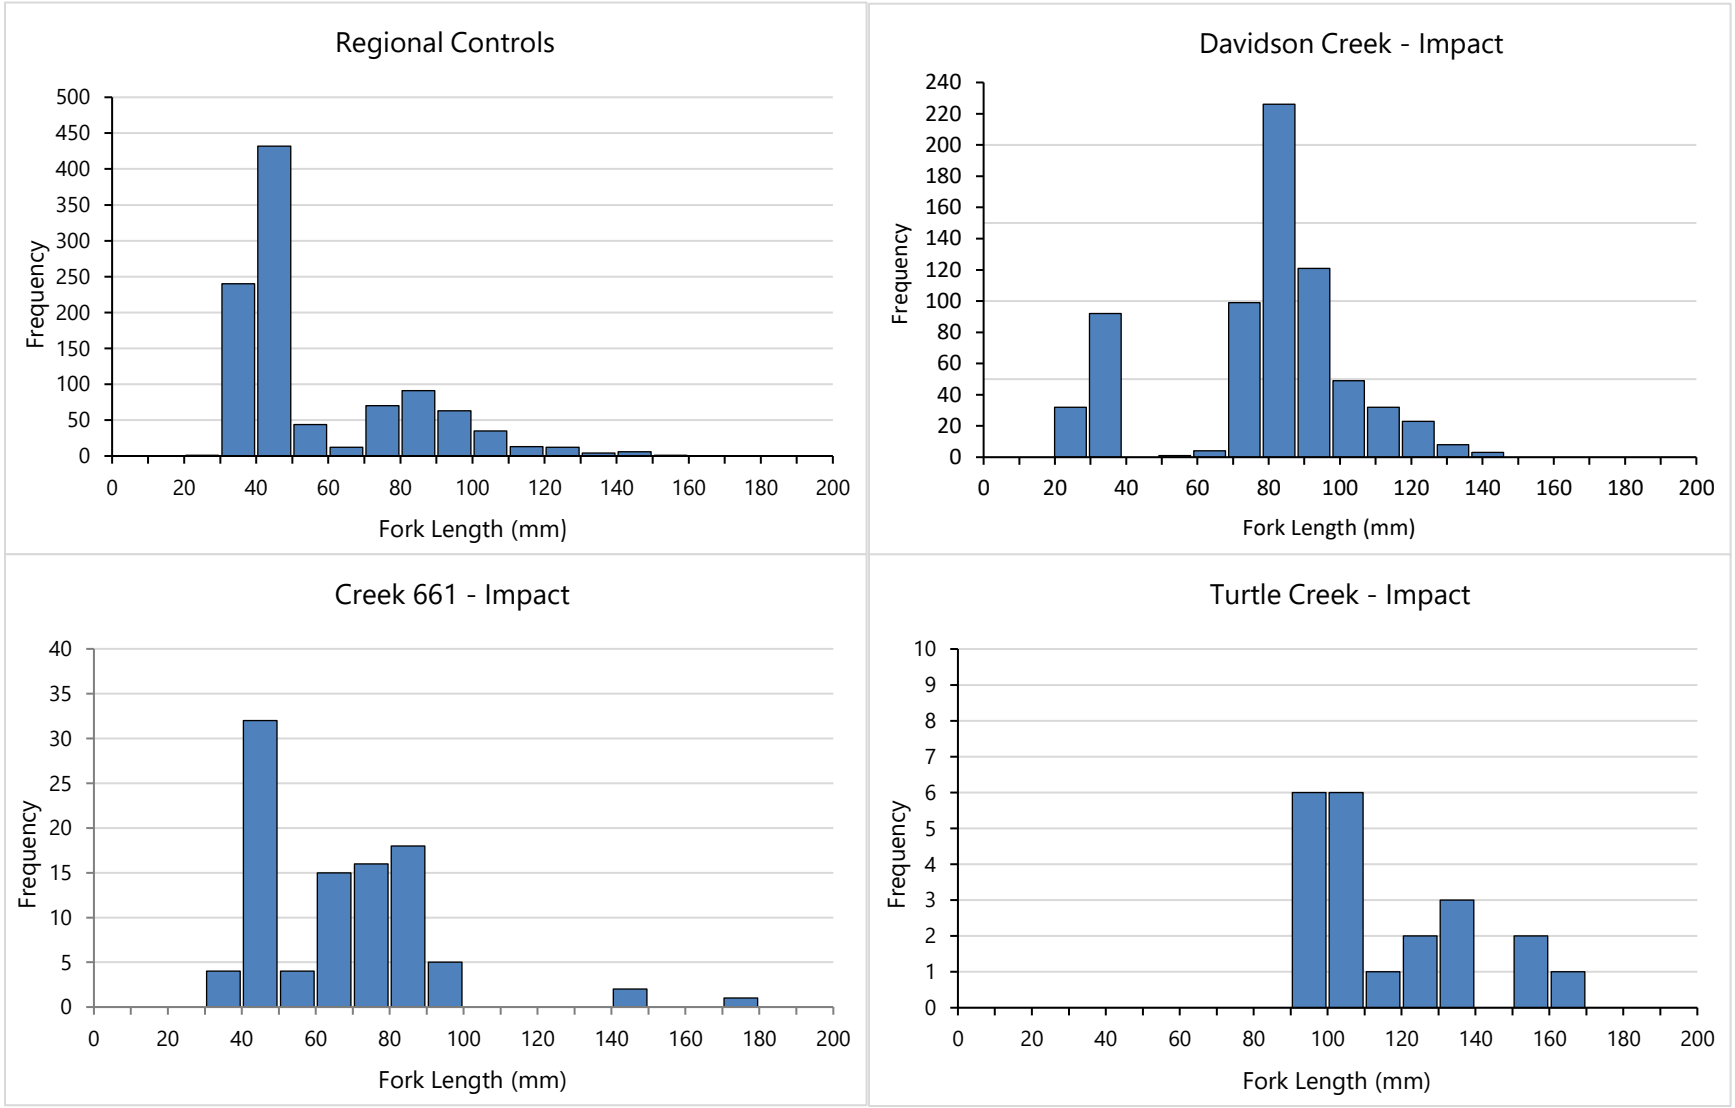


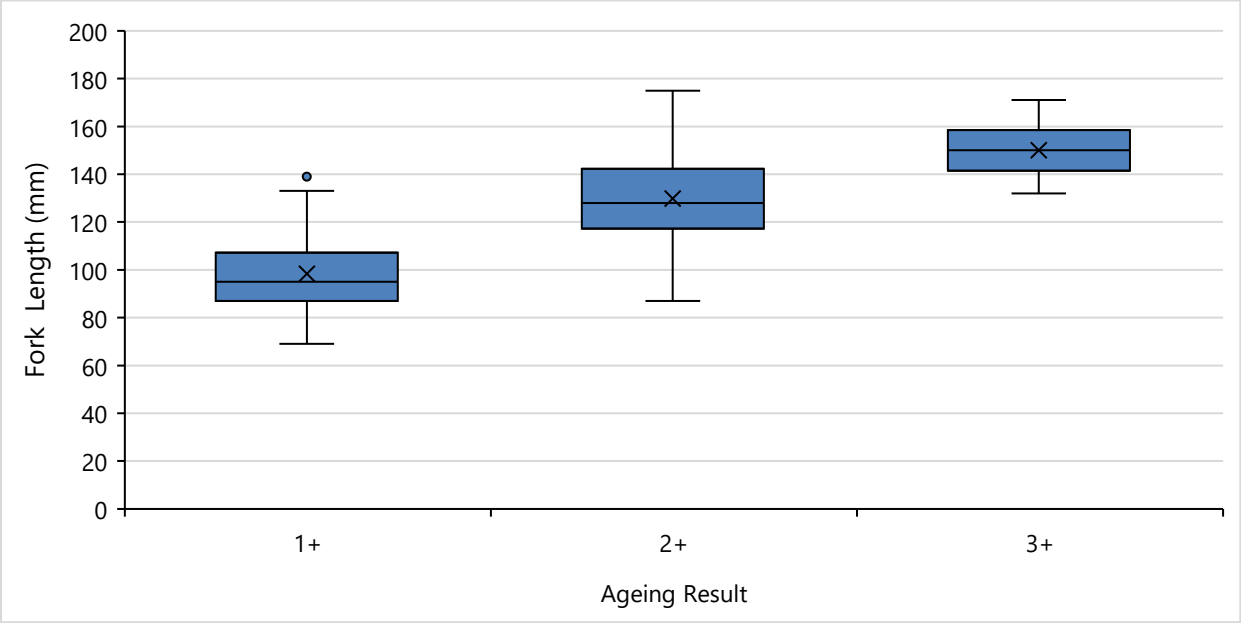
4.4.4 AEMP Fish Community Inventory Length and Age

The mean length of Rainbow Trout captured in AEMP streams at age 1+ was 98.4 mm, the mean length of 2+ fish was 129.8 mm, and the mean length of age 3+ fish was 150.1 mm. The distribution of fork length by age category is shown in Figure 4-15. Length to age regressions for the control and impact sites are shown in . No 2+ aged fish were captured in the 661 impact sites, and no 3+ aged fish were captured in the Davidson Creek impact sites.

Due to low capture numbers within the survey footprint at 661-05 and TC-05, electrofishing took place outside of the survey area to capture additional fish for tissue samples for metals analysis. The additional fish are included in this length-age analysis, despite not being included in other analyses throughout the report, as they were not sampled using multi-pass electrofishing in a closed system.

The comparison of regression slopes by ANCOVA found that growth rates were not significantly different between the regional controls or any of the impact sites. There was, however, a significantly larger size at age at the Turtle Creek impact sites compared to the regional controls (p = 0.04) and at the Creek 661 impact sites (p < 0.01) compared to controls. Statistical results are provided in Table 6 of Appendix 4.

Figure 4-15 Fork length distribution by age category for Rainbow Trout in AEMP stream sites, 2025



Note: Maximum and minimum length indicated by the error bars; outlier point displayed above the 1+ box; x denotes the mean, the 25 to 75 percentile are indicated by the edge of the shaded boxes, the line through the box denotes the median

4.5 Condition

4.5.1 YoY and Juvenile Rainbow Trout

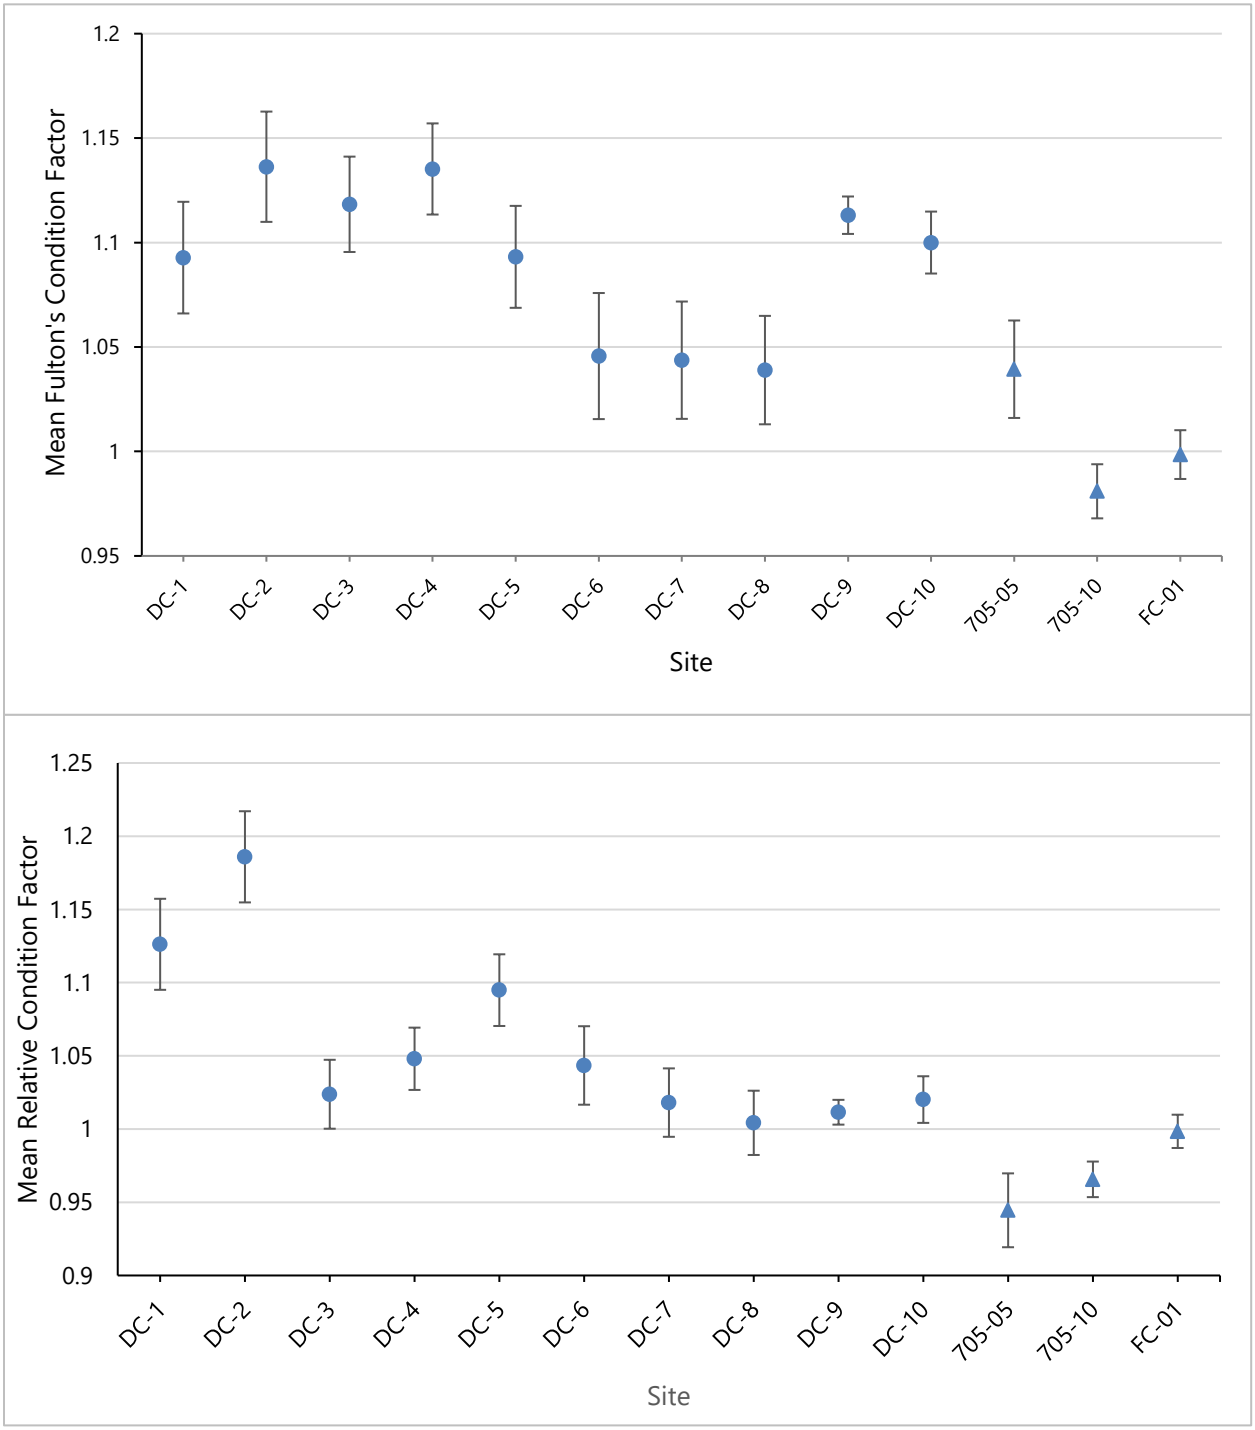
Indices of condition were compared among sampling sites (DC-1 to DC-10) following the methods described in section 3.1.5.5. Mean Fulton's and relative conditions with 95% confidence intervals for each site are shown in Figure 4-17. The mean Fulton's condition factor, including the lower confidence interval, were above 1.00 across all Davidson Creek sites. With the exception of sites DC-4 and DC-6, the data were non-normally distributed; therefore, Kruskal-Wallis tests were used for the site comparisons.

There were significant differences among sites ($p < 0.01$) in both relative condition and Fulton's condition. Within Davidson Creek, pairwise comparisons found that fish at DC-6, DC-7, and DC-8 had a significantly lower mean Fulton's condition factor than at DC-2, DC-4, and DC-9. Fish at DC-8 also had a significantly lower Fulton's condition factor than at DC-3 (Tables 7, 8, and 9 in Appendix 4).

Condition indices were significantly greater at the Davidson Creek sites compared to the AEMP control sites 705-10 and FC-01 (Tables 7, 8, 9, 10, and 11 in Appendix 4). Fulton's condition was significantly different between control site 705-05 and DC-2, DC-3, DC-4, DC-9, and DC-10. All Davidson Creek sites had a higher mean Fulton's condition factor than control sites 705-10 and FC-01. Every Davidson Creek site except for DC-8 had a higher mean Fulton's condition factor than 705-05.

Mean relative condition was greater in the Davidson Creek sites than the regional control sites. The data from all sites, except for DC-4, were non-normally distributed according to an Anderson-Darling test. DC-2 had the largest mean relative condition factor and was significantly different from every Davidson Creek site except for DC-5. DC-5 was significantly different than DC-3, DC-7, DC-8, DC-9, and DC-10. DC-1 was significantly different than DC-8, DC-9, and DC-10. All Davidson Creek sites were significantly different from the 705-05 and 705-10 regional control sites, and many were significantly different from FC-01 (Tables 10 and 11 in Appendix 4).

Figure 4-17. Mean Fulton's and relative condition of Rainbow Trout in Davidson Creek, 2025, compared to AEMP control sites

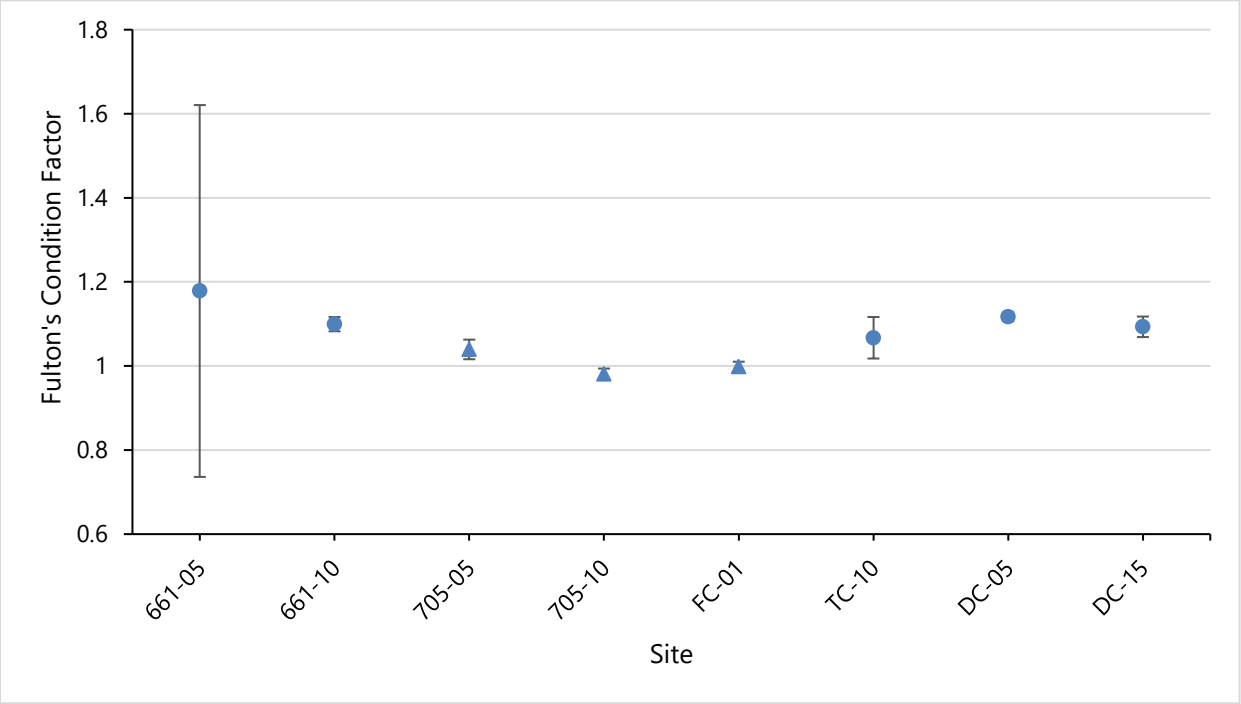


Note: Davidson Creek sites indicated by a circle, AEMP control sites indicated by a triangle and; 95% confidence intervals displayed.

4.5.2 AEMP Fish Community Inventory

Fulton's condition data were found to be non-normally distributed at all sites, except for 661-10. Insufficient numbers of fish were captured at 661-05 to conduct tests. Mean Fulton's condition factor was greater at the impact sites than at the control sites (Figure 4-18. Condition at 661-10 and DC-05 was significantly greater than at all three control sites (705-05, 705-10, and FC-01). Fulton's condition at DC-15 was also significantly different than that at 705-10 an FC-01 (Table 12 in Appendix 4).

Figure 4-18. Mean Fulton's condition of Rainbow Trout in AEMP streams, 2025



Note: AEMP control sites indicated by a triangle, and impact sites indicated by a circle; 95% confidence intervals displayed.

4.6 Mesohabitat Relative Abundance

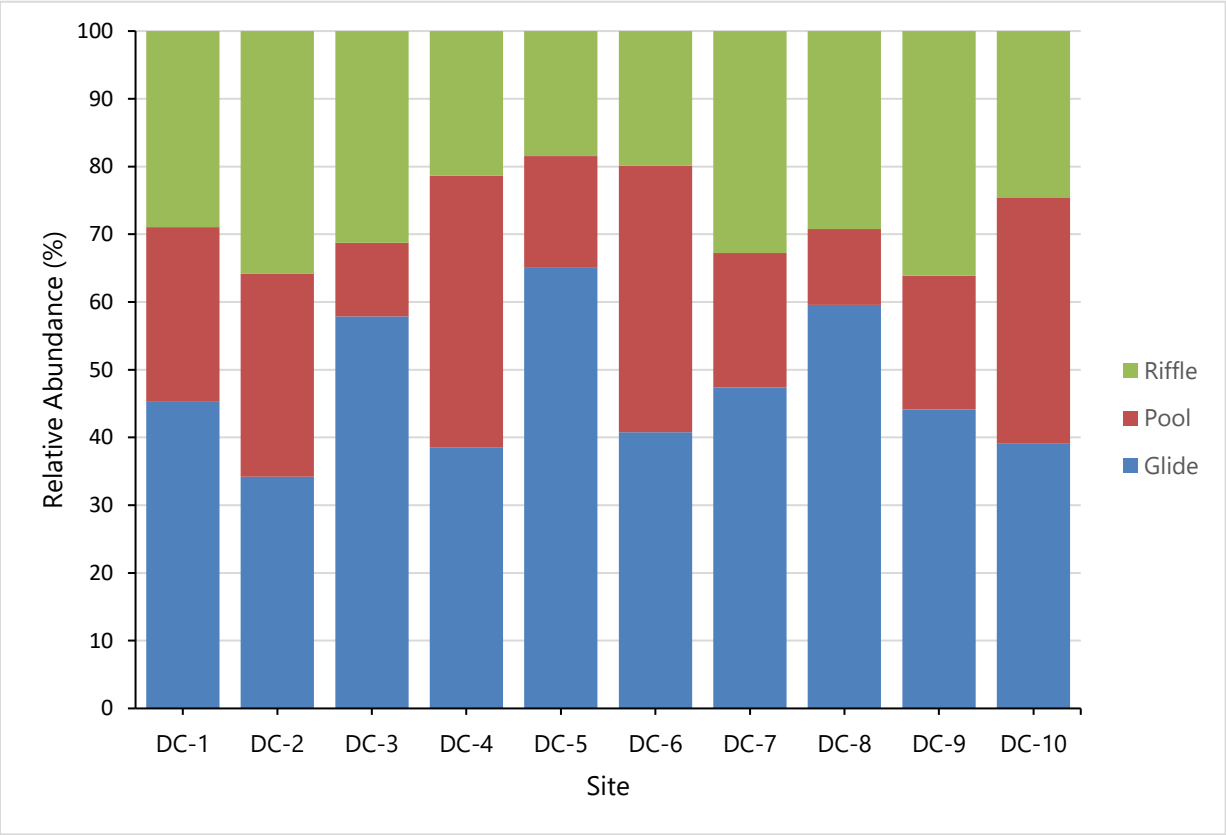
The dominant habitat type through most of the Davidson Creek sites was glide habitat (47% of all channel sections), followed by riffles (28%), then pools (25%) (Figure 4-19). Average channel measurements throughout each reach at the time of the survey can be found in Table 4-11. The dominant habitat type in DC-4 was pool due to a beaver dam creating a large, impounded area. The dominant habitat type in DC-2 was riffle habitat. No cascades were observed throughout the reaches.

The most common substrate types throughout the sites, where a full FHAP was conducted, were gravels, followed by cobbles, then fines. Boulders were only observed as a subdominant bed material at full FHAP sites in DC-5. The three most abundant cover types throughout Davidson Creek were deep pools, large woody debris, and overhanging vegetation.

Table 4-11. Summary of mesohabitat data collected during FHAP surveys in Davidson Creek, 2025

Site	*Number of Habitat Units*	*Average Channel Width (m)*	*Average Wetted Width (m)*	*Average Bankfull Depth (m)*	*Average Water Depth (m)*	*Average Gradient (%)*
DC-1	31	5.6	4.6	0.89	0.39	0.5
DC-2	38	7.5	4.9	1.09	0.51	0.7
DC-3	18	7.0	4.5	0.88	0.33	0.2
DC-4	22	5.9	4.8	0.70	0.27	0.1
DC-5	33	5.4	4.5	0.74	0.25	0.1
DC-6	35	6.4	3.8	0.78	0.28	0.1
DC-7	31	6.1	4.1	0.86	0.29	0.9
DC-8	27	6.0	4.7	0.75	0.24	0.9
DC-9	19	5.6	4.9	0.83	0.31	0.7
DC-10	23	6.1	4.9	0.70	0.34	0.5

Figure 4-19. Mesohabitat abundance in Davidson Creek, 2025



5.0 Closure

The 2025 YoY and Juvenile Rainbow Trout Abundance and Fish Community Inventory programs were successful in collecting and assessing data relating to long-term monitoring requirements under the FUP for Condition 3.14 and the AEMP. This 2025 report was compiled using data collected between July and September 2025, over a total of 19 days, to characterize the YoY and juvenile Rainbow Trout populations in Davidson Creek, and the fish community within the surrounding AEMP streams.

Field work included fish capture using closed-site, three-pass depletion electrofishing or minnow trapping, water quality measurements, fish processing, age structure collection, FHAP surveys, and discharge measurements.

The 2025 monitoring results will contribute to evaluating Davidson Creek, Creek 661, Creek 705, turtle Creek, and a Fawnie Creek tributary, with respect to mitigation effectiveness and to detect Mine-related effects under the FUP for Condition 3.14 and the AEMP.
