Con. Index	***Qualitative Characteristics (pattern clarity)***	***Quantitative Characteristics (repeatability)***
Very Good (VG)	annuli are clear with no interpretation problems	Reader always gets the same age
Good (G)	annuli are clear with a few easy interpretation problems	Reader would get the same age most of the time for fish <10 years, within one year for fish 11-20 years
Fair (F)	annuli are fairly clear with some areas presenting easy and moderate interpretation problems	Reader would be within 1 year most of the time for fish <10 years and 2-3 years for fish >10 years
Poor (P)	annuli are fairly unclear presenting a number of difficult interpretation problems	Reader would be within 2-3 years most of the time for fish <10 years and 4-5 years for fish >10 years
Very Poor (VP)	annuli are very unclear presenting significant interpretation problems	Reader has little confidence in repeatability of age within 4-5 years

APPENDIX 4

2025 STATISTICAL ANALYSIS RESULTS

Table A4-1. Likelihood ratio test p-values for catch probability among passes. Significant values are bolded ($p < 0.05$)

Site	*Likelihood ratio statistic*	*p-value*
DC-1	0.916	0.338
DC-2	0.757	0.384
DC-3	0.350	0.554
DC-4	0.058	0.809

1.0 Introduction

1.1 Project Description

The Blackwater Gold Mine (the Mine) is a gold and silver open pit mine located in central British Columbia (BC), approximately 112 kilometres (km) southwest of Vanderhoof, 160 km southwest of Prince George, and 446 km northeast of Vancouver. The Mine is located within the traditional territories of the Lhoosk'uz Dené Nation, Ulkatcho First Nation, Skin Tyee Nation, and the Tsilhqot'in Nation. The Mine's access road and transmission line cross the traditional territories of the Nadleh Whut'en First Nation, Saik'uz First Nation, Stellat'en First Nation, Nazko First Nation, Nee Tahi Buhn Band, Cheslatta Carrier Nation, and the Yekooche First Nation (BC Environmental Assessment Office [BC EAO] 2019a). The Mine footprint, located in the headwaters of the Davidson Creek and Creek 661 watersheds, includes an approximate area of 4,400 hectares, which accommodates the Mine, mine waste, ore processing, and on-site infrastructure.

New Gold Inc. received a Federal Decision Statement (DS) on April 15, 2019, under the *Canadian Environmental Assessment Act, 2012* (Canadian Environmental Assessment [CEA] Agency 2019), and an Environmental Assessment Certificate (EAC) #M19-01 on June 21, 2019, under the British Columbia 2002 *Environmental Assessment Act* (BC EAO 2019b). In August 2020, Artemis Gold Inc. (Artemis) acquired the mineral tenures, assets, and right in the Blackwater Project, that were previously held by New Gold Inc. The EAC was transferred to Blackwater Gold Ltd. (BW Gold), a wholly owned subsidiary of Artemis, on August 7, 2020, under the 2018 *Environmental Assessment Act* (BC EAO 2020). BW Gold received *Environmental Management Act* (EMA) Permit PE-110602 on June 24, 2021, authorizing early construction works, and Permit PE-110652, authorizing discharge of effluent from the Mine to surface water and groundwater, on May 2, 2023. The Mine's construction phase was initiated in September 2022, with works continuing through 2025. Mining operations commenced on May 1, 2025, with the expected life of the Mine being 23 years.

1.2 Regulatory Requirements and Objectives

In accordance with regulatory approval requirements, long-term aquatic monitoring programs have been designed and implemented for waterbodies in the Mine area to detect changes to aquatic resources and to determine if these changes constitute mine-related effects. Condition 3.14 of the DS required BW Gold to develop a Fish and Fish Habitat Follow-Up Program (FUP) to be implemented during all phases of the Mine, to verify the accuracy of the environmental assessment (EA) and to assess the efficacy of fish and fish habitat mitigation measures for Davidson Creek; the 'Follow-up Programs for Condition 3.14 of the Blackwater Gold Decision Statement Issued under Section 54 of the Canadian Environmental Assessment Act' ((Palmer Environmental Consultants Group Ltd. [Palmer] 2023a) was developed to fulfill this condition.

Condition 3.16 of the DS required BW Gold to develop a FUP to be implemented during all phases of the Project to verify the accuracy of the EA and to determine the effectiveness of mitigation measures as it pertains to fish habitat in Tatelkuz Lake and Chedakuz Creek. The 'Follow-Up Programs for Condition 3.16 of the Blackwater Gold Decision Statement Issued under Section 54 of the Canadian Environmental Assessment Act' (Palmer 2023b) was developed to fulfill this condition.

The 'Aquatic Effects Monitoring Program (AEMP) Plan Version 4.0' (ERM & Triton 2025) was developed to address Permit PE-110652 Condition 4.6 and Condition 30 of the EAC #M19-01. The AEMP has been designed to provide information on the aquatic receiving environment and to detect potential Mine-related effects on the AEMP components (physical, chemical, biological).

1.3 Scope of Work

This report summarizes the Kokanee (*Oncorhynchus nerka*) Spawner field program, conducted from mid July to the end of September 2025. These field programs were undertaken to fulfill monitoring requirements described in the FUP for Condition 3.14, the FUP for Condition 3.16, and AEMP Plan Version 4.0.

Specifically, in relation to Condition 3.14, this field program pertained to sub-conditions 3.14.2.1 – community composition, abundance, genetic structure, and diversity of Rainbow Trout (*Oncorhynchus mykiss*) and Kokanee; and 3.14.2.3 – characteristics of spawner populations. Furthermore, in relation to Condition 3.16, this field program pertained to sub-condition 3.16.3 – Lower Chedakuz Creek monitoring during all project phases.

1.4 Measurement and Assessment Endpoints

Measurement and assessment endpoints are specified in the FUP for Condition 3.14 (Palmer 2023a), the FUP for Condition 3.16 (Palmer 2023b), and AEMP Plan V4.0 (ERM & Triton 2025); endpoints relevant to the Kokanee Spawner Program are provided in Table 1-1, Table 1-2, and Table 1-3 for ease of reference.

The measurement endpoints for the Kokanee Spawner Program include assessing fish and redd abundance, size at maturity, substrate composition, and the genetic structure of Kokanee. Assessment endpoints for each of the three programs are similar to one another and include the number and density of spawning Kokanee, the number and density of Kokanee redds, fish length at maturity, substrate composition, genetic deviation, and mesohabitat relative abundance.

Table 1-1. FUP for Condition 3.14 measurement and assessment endpoints

Measurement Endpoint	*Assessment Endpoint*
Fish abundance	Relative number of adult spawners and their density observed in each survey reach
Redd abundance	Relative number of redds and their density observed in each survey reach
Fish size at 100% maturity	Length and age at 100% maturity of Kokanee returning to Davidson Creek
Substrate composition	Mean percent composition of substrate within each spawning reach of Davidson Creek
Genetic structure	Deviation from population equilibrium

Table 1-2. FUP for Condition 3.16 measurement and assessment endpoints

Measurement Endpoint	***Assessment Endpoint***
Fish abundance	Relative number of adult spawners and their density observed in each survey reach
Redd abundance	Relative number of redds and their density observed in each survey reach
Fish size at 100% maturity	Length and age at 100% maturity of Kokanee returning to Lower Chedakuz Creek

Table 1-3. AEMP measurement and assessment endpoints

Measurement Endpoint	***Assessment Endpoint***
Kokanee Spawning	Number of spawning Kokanee and Density (Kokanee/100 m^2)
	Number of redds and red density (redds/100 m^2)
	Fish length at 100% maturity
	Substrate composition (geometric mean diameter and percent composition of less than 0.85 mm diameter)
	Mesohabitat relative abundance

2.0 Sampling Sites

Under the three monitoring programs, Kokanee spawning surveys were conducted within three watercourses: Davidson Creek, Middle and Lower Chedakuz Creek, and Creek 661 (Figure 2-1).

Monitoring of Kokanee spawning under the FUP for Condition 3.14 occurred through five discrete sampling sections in Davidson Creek: DC-1A-KO, DC-1B-KO, DC-2-KO, DC-3-KO, and DC-4-KO (Figure 2-1). The total survey length was 5,090 m, which encompassed the entire known and historical Kokanee spawning distribution (Table 2-1).

Monitoring of Kokanee spawning under the FUP for Condition 3.16 occurred through a single section, CC_3.16, in Lower Chedakuz Creek (Figure 2-1). This section began at the outlet of Tatelkuz Lake and ended at the confluence with Davidson Creek, covering a length of 843 m (Table 2-1).

Monitoring of Kokanee spawning under the AEMP occurred through 16 discrete representative survey sections. This included two sections in Davidson Creek (DC-1A-KO and DC-3-KO), four sections in Middle Chedakuz Creek (CC-02A-KO, CC-02B-KO, CC-05A-KO, and CC-05B-KO), two sections in Lower Chedakuz Creek (CC-15A-KO and CC-15B-KO), and two sections in Creek 661 (661-20A-KO and 661-20B-KO). Six additional sections in Creek 661 (661-20C-KO, 661-20D-KO, 661-20E-KO, 661-20F-KO, 661-20G-KO, and 661-20H-KO) were added in 2025 to determine the entire Kokanee spawning distribution at the request of the Nechako First Nations (NFNs) (Figure 2-1, Table 2-1). Under the study design of the AEMP program, two survey sections (CC-02A-KO and CC-02B-KO) upstream from potential Mine impacts act as control sites. The total survey length for all the AEMP sites was 16,045 m, including 2,341 m in Davidson Creek, 3, 896 m in Middle Chedakuz Creek, 1,921 m in Lower Chedakuz Creek, and 7,887 m in Creek 661.

* - Sections 661-20C-KO through 661-20H-KO survey lengths are measured map distances rather than FHAP field measurements

3.0 Methods

Field work conducted during the 2025 Kokanee Spawner program consisted of visual spawner and redd surveys, water quality measurements, substrate sampling, fish habitat assessments (according to Fish Habitat Assessment Procedures [FHAP]; Johnston and Slaney 1996), carcass measurements, otolith collection, and underwater camera deployment. No tissue collection for genetic analysis occurred in 2025 as the planned frequency is once every four years; genetics sampling was last completed in 2024. The data collected during the 2025 Kokanee Spawner Program build on data collected in previous years and in other field programs to compare and measure the assessment endpoints for the FUP for Condition 3.14, the FUP for Condition 3.16, and the AEMP. Table 3-1 summarizes the data collected in 2025 under each of the three programs.

3.1 Kokanee Visual Bank Walk Surveys

3.1.1 Timing

Weekly visual Kokanee spawner bank walk surveys were conducted over a 69-day period from July 19 to September 26, 2025. Bank walk survey dates are provided in Table 3-2. In accordance with the implementation framework (ERM & Triton 2025), visual bank walk surveys commenced approximately one week prior to the estimated start of spawning based on previous studies. Bank walks began on Davidson Creek in mid July, Middle Chedakuz and Creek 661 in early August, and Lower Chedakuz Creek in mid August.

The bank walk survey termination triggers were met when the Kokanee spawning peak had been observed within each watercourse (or the second peak was observed in survey sections where bimodal distributions were documented) and Kokanee observations within the survey sections were 1% or less of the total observations recorded for each section. Where potential fish barriers were identified, bank walk surveys were continued until Kokanee were no longer observed upstream and the spawning peak was observed within the downstream survey sections.

3.1.2 Field Methods

Bank walk surveys were conducted through 20 survey sections in Davidson Creek, Chedakuz Creek, and Creek 661 to estimate adult Kokanee abundance as well as redd abundance. Efforts were made to replicate the bank walk extents previously used by Palmer Environmental Consulting Group Inc. (Palmer) in 2023 and Triton in 2024, with the exception of DC-2-KO where the upper extent (end) was shifted downstream of a large (2.2 m high) beaver dam to better capture the lack of Kokanee upstream of this migration barrier. Upstream and downstream extents were identified via Global Positioning System (GPS) waypoints and the presence of old flagging. In instances where old flagging could not be found, new flagging was installed based on the historical GPS waypoint.

Bank walk surveys were conducted by a two-person crew walking in an upstream direction and outside the wetted width where possible, to prevent disturbing spawning Kokanee and Kokanee redds. Live and dead Kokanee were counted individually by each crew member and counts compared at the end of the survey section; the counts with larger numbers were recorded. Surveys were terminated in sections where Kokanee were deemed absent upstream of a migration barrier (e.g., beaver dam) after repeated surveys with no Kokanee observations, and where the peak was observed in downstream survey sections. Surveys were ceased at the end of the spawning season when spawning was deemed complete through repeated surveys with few to no (1% or fewer) Kokanee observations in a given survey section.

Live adult Kokanee were further categorized into the following groups depending on their observed behaviour:

- Holding/migrating:
    - Holding – unpaired and actively shoaling, usually under cover or in deep pools
    - Migrating – swimming steadily upstream, usually unpaired,
- Spawning – courting with one or more individuals, digging/guarding redds usually with caudal fin wear, and
- Spent – lethargic, usually in slow pools, backwater, or drifting downstream, with potential damage to body/fins.

A percentage value of observer efficiency (OE) was applied to each section for each survey. OE is the probability that a spawning Kokanee was or could be seen by the observer. The OE value was determined according to several factors that could influence counting efficiency:

- Percent bankfull stream wetted width and depth (less than 25%, 25 to 50%, 50 to 100%, and greater than 100%), recorded every 200 m at the same location for each survey,
- Water clarity (0 to 0.25 m, 0.25 to 0.5 m, 0.5 to1.0 m, 1 to 3 m, and greater than 3 m),
- Brightness (Full, Bright, Medium, and Dark),
- Percent cloud cover (0, 25, 50, 75, and 100%),
- Precipitation type and intensity,

- Cover types and abundance (i.e., large woody debris, deep pools, and undercut banks; none, trace, moderate, or abundant), and
- Percent crown closure (0, 1-20%, 21-40%, 41-70%, 71-90%, greater than 90%).

Redds were identified and counted in each section based on observations of cleaned gravel patches and depressions in suitable spawning areas. The location of each identified redd or redd complex was recorded using digital field data mapping software (ArcGIS Field Maps). The use of mapping software enabled observers to avoid disturbing previously identified redds during subsequent surveys. A redd revisit form within the mapping software was used to monitor redd locations throughout the survey duration; redd observations including photos, counts, fish observations and comments were uploaded during each visual bank walk survey and revisited on subsequent surveys.

Dead Kokanee spawners, hereinafter referred to as carcasses, were encountered during the bank walk surveys. A subset of these carcasses was assessed for sex, measured for fork length and postorbital-hypural length, and sampled for age structures (i.e., otoliths). Otoliths were collected throughout the migration period to reduce potential for temporal bias. Collected otoliths were placed in plastic vials and in scale envelopes (i.e., coin envelopes) to avoid breakage and sent to North/South Consultants Inc. in Winnipeg, Manitoba on September 29, 2025, for age analysis. A sample size of 100 carcasses was targeted for otolith collection in Davidson Creek, while 30 carcasses were targeted for all other watercourses. Dead fish were cut in half to avoid recounting on subsequent bank walks, with females being internally assessed as either:

- Spent (approximately 100% of eggs released);
- Partially spawned (approximately 50% of eggs released); or
- Not spawned (approximately 0% of eggs released).

In situ water quality measurements were recorded at the downstream (start) and upstream (end) extent of each bank walk survey section. Measurements collected included temperature in degrees Celsius (°C), pH, specific conductivity in microsiemens per centimetre (µS/cm), dissolved oxygen in milligrams per litre (mg/L) and percent saturation (%), and turbidity in nephelometric turbidity units (NTU). Water quality measurements were collected using a YSI ProQuatro multiparameter meter and a LaMotte turbidity meter. Bankfull and wetted width channel measurements were recorded every 200 m within each survey section.

3.1.3 Laboratory Methods

Age analysis was conducted by North/South Consultants Ltd. Otoliths were thin sectioned and set in Cold Cure epoxy to harden for 48 hours. The nucleus was marked with a fine tipped marker and two points on either side of the nucleus. Using a Struers Minitom low speed sectioning saw, the otolith was sectioned by connecting the line through the nucleus. Depending on otolith size, two sections were taken. The sections of otolith were then permanently mounted on a microscope slide with Cytoseal-60 and viewed under a microscope with transmitted light. All otoliths were read by an experienced ageing technician, with structures rated on quality based on the following confidence index:

- Very good – annuli are clear with no interpretation problems.

- Good – annuli are clear with few easy interpretation problems.
- Fair – annuli are fairly clear with some areas presenting easy and moderate interpretation problems.
- Poor – annuli are fairly unclear presenting a number of difficult interpretation problems.
- Very Poor – annuli are very unclear presenting significant interpretation problems.

3.1.4 Quality Assurance/Quality Control

Water quality meters were calibrated each morning prior to use. Calibration solutions for conductivity (1,413 µS/cm) and pH (4.01, 7.01, and 10.01 pH) were used to calibrate the YSI ProQuatro multiparameter meters. The dissolved oxygen sensor was calibrated in the field prior to use. Sensor membranes and fluid were replaced when required. Lamotte turbidity meters were calibrated with solution (0, 1, 10, or 100 NTU) in the expected turbidity range for the watercourse.

Field crews were experienced and knowledgeable of fish species present in the local watersheds. A subset of observed fish were photographed for species identification verification. Otolith vial envelopes were labeled with date, site name, and unique fish ID. Otolith sample inventories were compiled, maintained, and verified prior to shipping to laboratories. Chain-of-custody forms were completed and shipped with samples for laboratory analysis.

Field data, photographs, and mapping information collected on digital platforms were examined for completeness prior to nightly uploads to cloud servers to mitigate the risk of data loss.

North/South Consultants Ltd. completed quality control and quality assurance for age structures, which was conducted independently by an alternate ageing technician on a randomly selected subset (10%) of otoliths. If 90% agreement was not achieved with regard to age, all structures were re-analyzed using a three-reader consensus approach.

3.1.5 Data Analysis

3.1.5.1 Spawner Abundance

To standardize counts of Kokanee spawners, Kokanee spawner density was calculated as the number of fish observed divided by the length and average wetted width (i.e., area) of each survey section and was expressed as the number of fish per 100 m^2. Lengths of individual survey sections were derived from FHAP data with the exception of 661-20C-KO through 661-20H-KO where site lengths are measured map distances.

Estimates of Kokanee abundance were calculated using the area-under-the-curve (AUC) method. This involved calculating the area under the plotted curve of abundance versus sampling date using integration. The area under this curve gives the estimated total number of fish-days, calculated as:

$$AUC = 0.5\sum(t_i - t_{i-1})(p_i - p_{i-1})$$

Where:
t_i is the number of days from the first to the *ith* survey day
p_i is the number of OE-adjusted fish observations from the first to the last day of survey.

Two AUC methods were employed: Gaussian AUC (quasi-Poisson generalized linear model; GAUC) and Trapezoidal AUC (TAUC) methodologies outlined by (Millar and Jordan 2013). The AUC calculations were conducted with RStudio (RStudio Team, 2025) and used the live counts obtained from visual surveys, adjusted for OE (Palmer 2023b, Palmer, 2023c).

In Davidson Creek, weekly bank walk surveys were completed through all sections on the same day. In Creek 661, bank walk surveys were completed over a two-day period within the same week (Table 3-2) to cover all sections, with four sections completed per day; we assumed fish did not move between the lower four sections and the upper sections over the two-day sampling period, and we used the first survey date for the purposes of the AUC calculations. Escapement was not calculated for Chedakuz Creek sections (CC-15, CC_3.16, , CC-02 and CC-05) as the entire length of the watercourse was not surveyed.

Escapement was estimated by dividing the AUC estimate by a value of survey life (synonymous with residence time).

$$Escapement\ (E) = AUC \div SL$$

Survey life (SL) is the length of time from when fish enter the survey area to the time they perish and is typically a stream-specific value. Currently, creek specific SL for Davidson Creek and Creek 661 are unknown; derivation of SL is beyond the scope of this monitoring program, hence a province-wide average literature value of 12.4 ± 0.8 days (based on 43 literature values) has been used in previous years to calculate the estimated escapement (Palmer 2023c)

3.1.5.2 Redd Abundance

Redd density was calculated as the number of redds observed divided by the length times average wetted width of each surveyed section, and it was expressed as the number of redds per 100 m^2. Lengths of individual survey sections were derived from FHAP data with the exception of 661-20C-KO through 661-20H-KO where site lengths were measured map distances.

3.1.5.3 Length and Age at 100% Maturity

Both mean fork length and mean postorbital-hypural length were statistically compared among sites. First, the distributions were tested for normality using an Anderson-Darling test and if normally distributed, two sample T-tests were computed to compare the respective lengths. Size at maturity distributions were calculated by determining the mean age for each survey section. The mean postorbital-hypural length, mean fork length, and standard deviation (SD) were calculated for each age class and each survey section. A control-impact analysis (with a one-way Analysis of Variance [ANOVA]) was conducted for spawner length at maturity for AEMP sites. Significance was assumed when $p < 0.05$.

3.2 Fish Habitat Assessment Procedure Survey

3.2.1 Timing and Field Methods

Detailed fish habitat data were collected prior to the arrival of Kokanee spawners to evaluate changes in habitat availability. Habitat assessments were conducted in July and August 2025 through 14 survey sections in Davidson Creek, Middle and Lower Chedakuz Creek, and Creek 661; Survey dates are provided in Table 3-3.

Habitat assessments followed the Level 1 methodologies of the Fish Habitat Assessment Procedures manual developed by Johnston and Slaney (1996). This involved dividing a survey section into distinct, naturally occurring habitat units (cascades, glides, pools, riffles, or other), as well as measuring several components of the habitat (length, bankfull and wetted widths and depths residual pool depths riffle crest depths) and describing specific features (bed material, cover types and percentages for a subset of each habitat unit encountered). Surveys were conducted in an upstream direction with GPS waypoints collected at the lower extent of each habitat unit using an EOS Arrow 100 to improve location accuracy. Discharge measurements were collected at the start of each survey using a Swoffer Model 2100 Current Velocity Meter.

Table 3-3. Fish habitat assessment procedure sampling dates

AEMP	Creek 661	661-20A-KO	July 22, 2025
AEMP	Creek 661	661-20B-KO	July 22-23, 2025

3.2.2 Quality Assurance/Quality Control

FHAP surveys were conducted by a combination of the same field crew members to maintain consistency across all sites. Field data, photographs, and mapping information collected on digital platforms were examined for completeness. To mitigate the risk of data loss, data were collected digitally using Triton's specific FileMaker database and were backed up nightly by field crews.

3.2.3 Data Analysis

The relative abundance of each habitat type unit was calculated for each survey section using Microsoft Excel.

3.3 Substrate Composition

3.3.1 Timing and Field Methods

Substrate sampling was conducted at six sites that were not sampled during the 2024 field program. Substrate samples could not be collected at all sites in 2024 due to wildfire activity and, once fieldwork resumed, the presence of spawning Kokanee and redds. As such, the remaining six sites were sampled in July 2025 prior to the start of Kokanee spawning. Sampling dates are provided in Table 3-4.

Substrate sampling was conducted to characterize and monitor changes to substrate composition in Kokanee spawning areas. Four riffle crests were selected within each survey section for substrate sampling prior to the arrival of Kokanee spawners; the location of each sampled riffle crest was marked in the field with flagging tape and recorded using a handheld GPS unit. At each riffle crest, three samples were collected at 25%, 50%, and 75% of the channel width, totalling 12 substrate samples for each survey section. Samples were collected using a modified McNeil core sampler in accordance with the methods described in the British Columbia Field Sampling Manual, Part D (BC MOECCS 2020). Substrate samples were shipped to the Australian Laboratory Services Pty Ltd. (ALS) for laboratory particle size distribution analysis.

Table 3-4. Substrate sampling dates

Program	*Waterbody*	*Survey Section*	*Substrate Sampling Dates*
AEMP	Middle Chedakuz Creek	CC-05A-KO	July 21, 2025
AEMP	Middle Chedakuz Creek	CC-05B-KO	July 20, 2025
AEMP	Middle Chedakuz Creek	CC-02A-KO	July 25, 2025
AEMP	Middle Chedakuz Creek	CC-02B-KO	July 28, 2025
AEMP	Creek 661	661-20A-KO	July 23, 2025
AEMP	Creek 661	661-20B-KO	July 24, 2025

3.3.2 Laboratory Methods

Particle size distribution analysis was completed by ALS and followed the Salmonid Spawning Gravel Composition module in the Timer, Fish and Wildlife Ambient Monitoring Program manual and method manual (Schuett-Hames et al. 1994, Schuett-Hames et al. 1999). Briefly, this involved three methods: dry sieving, wet sieving, and sedimentation using a pipette. The data from the three particle sizing methods were combined, and individual particle sizing (0.125 mm, 0.25 mm, 0.5 mm, 0.85 mm, 1.0 mm, 2.0 mm, 4.0 mm, 8.0 mm, 16.0 mm, 32.0 mm, and 64.0 mm) along with the proportional weight of material was reported.

3.3.3 Quality Assurance/Quality Control

ALS completed the quality control and quality assurance for sediment samples collected. These reports are included in Appendix 3.

3.3.4 Data Analysis

The mean, maximum, minimum, and standard deviation were calculated for the percent substrate smaller than 0.85 mm, and the geometric mean diameter was calculated for each of the samples. The percentage of substrates less than 0.85 mm has been used as an indicator of changes to substrate caused by land management activities, while the geometric mean diameter has been correlated with survival to emergence in salmonids (Schuett-Hames et al. 1994).

The geometric mean distributions were tested for normality using a Shapiro-Wilk test, followed by a Kruskal-Wallis test to test significant difference in the geometric mean diameter among the survey sections. The H statistic for the Kruskal-Wallis test was approximated by Chi-Squared distribution. This analysis was used to determine if the geometric mean diameter was consistent between the survey sections. The significance threshold was set at $p < 0.05$.

3.4 Underwater Camera

3.4.1 Timing and Field Methods

A motion-activated underwater camera (Biotactic G3) was installed at the mouth of Davidson Creek prior to the commencement of the Kokanee spawning migration to estimate total abundance of fish entering Davidson Creek. It was installed on July 15, 2025, and remained in the watercourse for the entire Kokanee spawning migration period, until it was removed on September 21, 2025. The camera was mounted inside a constructed viewing tunnel and powered by batteries and solar panels erected on the shoreline. The viewing tunnel was integrated into a rigid fish fence spanning the width of the channel; the setup ensured all migrating fish needed to pass through the camera viewing tunnel. The camera was triggered by movement of fish traveling through the viewing tunnel and was set to record video clips to the camera's computer once activated. A measuring board was mounted on the inside of the viewing tunnel allowing fish length to be assessed during video review.

The integrity of the rigid fence and viewing tunnel was inspected daily, with cleaning and modifications or repairs completed as necessary. The video recordings were downloaded daily to an external hard drive and were backed up to a second external hard drive each evening to mitigate the risk of data loss.

3.4.2 Data Analysis

Videos were reviewed by a technician proficient in fish identification using VLC Media Player to determine fish species, number of fish, and direction of movement. Videos were viewed at three to four times regular speed until a fish was observed, at which point the video was slowed to half speed or paused to determine fish species identification, direction of movement, length (cm), and number of fish.

4.0 Results

4.1 Field Program

Similarly to 2023 and 2024, the DC-3-KO section on Davidson Creek was heavily impacted by beaver activity. During the 2024/2025 field season, existing beaver dams were higher and longer than in previous years, and several new dams and complexes were constructed (Appendix 1: Photo 6). The numerous dams are believed to have potentially restricted and impeded Kokanee upstream migration such that no evidence of adult Kokanee (alive or dead) or Kokanee redds was detected upstream of a large 2.2 m high dam at the downstream end of DC-3-KO. As a result, the upper extent of DC-2-KO was shifted downstream in 2025 to better capture and reflect the lack of Kokanee upstream from this migration barrier. In addition, due to a lack of any observed Kokanee or evidence thereof, after six consecutive weeks of surveys, and peak counts observed in lower survey sections, it was determined that bank walks through DC-3-KO and DC-4-KO could cease on August 29, 2025.

A newly constructed beaver dam was observed during the first week in September in Middle Chedakuz Creek, located mid-section in CC-05A-KO; the dam was estimated to be approximately 3 m high and 16 m long. The beaver dam was holding back approximately 1.5 m of water, flooding both sides of upstream banks. It was determined that this dam has potential to impede the upstream migration of Kokanee (Appendix 1: Photo 11).

In 2025, spawner surveys were conducted on the entire length of known Kokanee distribution in Creek 661. Each section was surveyed weekly between late July and mid September, except for sections 661-20G-KO, and 661-20H-KO where the last week of July was missed due to challenging terrain and environmental conditions. No Kokanee or redds were detected upstream of a large 1.5 m high beaver dam and 0.75 m plunge pool combination located mid-section in 661-20E-KO (Appendix 1: Photos 9 and 10). It was determined that bank walks on 661-20F-KO, 661-20G-KO, and 661-20H-KO could cease on September 8, 2025 due to a lack of any observed Kokanee, or evidence thereof, after six weeks of surveys.

4.2 Kokanee Visual Spawner Surveys

The data collected during the visual spawner surveys, including live and dead Kokanee counts, redd counts, and detailed survey information, is summarized by survey section and date in Appendix 2.

4.2.1 Timing

Approximate dates of Kokanee spawner run timing observed during the 2025 season are provided in Table 4-1.

Kokanee were first observed in Davidson Creek on July 26, 2025, aligning with the mid July survey commencement trigger of the AEMP implementation framework. The peak spawner count occurred on August 15, 2025 in DC-1A-KO and DC-1B-KO, while DC-2-KO peaked a week later on August 22, 2025. The survey termination trigger was met on September 24, 2025, with one

Kokanee observed in DC-1A-KO, and none in DC-1B-KO and DC-2-KO. No Kokanee or Kokanee redds were observed in DC-3-KO or DC-4-KO.

In Middle Chedakuz Creek, Kokanee were observed in all survey sections by August 16, 2025, supporting the implementation framework survey commencement trigger of early August. One Kokanee was first observed in CC-05A-KO on July 27, 2025, followed by two visual surveys with no observations until August 16, 2025. Kokanee abundance peaked between August 23 and 30, 2025. The survey termination trigger was met in the CC-02 and CC-05 sections on September 13 and 26, 2025, respectively with 24 Kokanee (1% or less of observations) remaining in CC-05B-KO.

Kokanee were first observed in lower Chedakuz Creek between August 5 and 26, 2025, a week following the mid August commencement trigger. There was only one fish observed in CC-15A-KO throughout the survey period, with no defined peak. One Kokanee was observed in CC-15B-KO on September 16, 2025, meeting the termination trigger.

In Creek 661, the first Kokanee observation was made on August 17, 2025 in 661-20A-KO, supporting the implementation framework survey commencement trigger of early August. The termination trigger was met between September 14 and 15, 2025; no Kokanee were observed in sections 661-20A-KO through 661-20E-KO. No Kokanee or Kokanee redds were observed in 661-20F-KO through 661-20H.

4.2.2 Kokanee Abundance

Cumulatively, 30,690 live Kokanee were recorded across all surveys and survey sections in 2025. It should be noted that cumulative counts may include recounted individual Kokanee spawners throughout the survey period. Middle Chedakuz Creek accounted for 64% (*n* = 19,607) of the total counts, followed by Davidson Creek at 29% (*n* = 8,882), Creek 661 at 7% (*n* = 2,181) and Lower Chedakuz Creek at 0.1% (*n* = 2). By site, CC-05B-KO accounted for 39% (*n* = 12,014) of the Kokanee observations, followed by CC-05A-KO (19%, *n* = 5,689), and DC-1A-KO (14%, *n* = 4,335; Figure 4-1). No Kokanee were observed in DC-3-KO, DC-4-KO, 661-20F-KO, 661-20G-KO, or 661-20H due to large beaver dams at the upper extent of DC-2-KO and mid way through 661-20-E.

Peak Kokanee counts and density by survey section are provided in Table 4-2. The peak count is the greatest number of fish observed in any one day. When comparing Kokanee density between the survey sections , CC-05B-KO had the highest daily peak density of 109.7 fish/100m^2 followed by CC-05A-KO at 37.7 fish/100m^2 (Figure 4-2) and DC-1B-KO at 36.1 fish/100m^2 (Figure 4-3). The lower section of Creek 661 (661-20A) had the highest peak density of 19.1 fish/100m^2 occurring around August 24, 2025 while the upper sections had lower densities ranging from 0.6 to 5.0 fish/100m^2 (Figure 4-4). Lower Chedakuz Creek exhibited the lowest densities across all survey sections with a peak of 0.12 fish/m^2 in CC-15B-KO occurring around August 26, 2025 (Figure 4-5).

Table 4-2. Peak count and density of spawning Kokanee by survey section

Waterbody	*Survey Section*	*Kokanee Count*	*Kokanee Density (# /100 m^2)*
Davidson Creek	DC-1A-KO	1,159	21.2
	DC-1B-KO	822	36.1

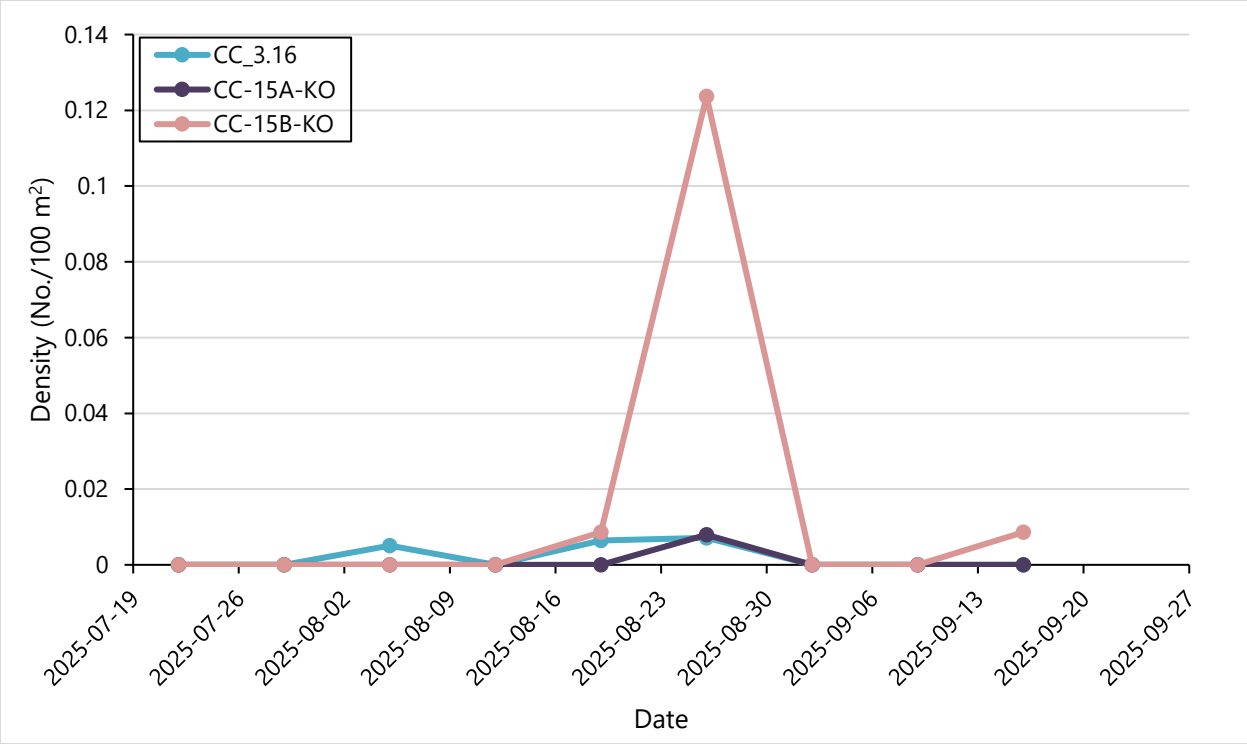
Figure 4-5. Density of Kokanee in Lower Chedakuz Creek survey sections by survey date



Observer efficiency ranged from a minimum of 30% to a maximum of 95% (Table 4-3). Creek 661 exhibited the lowest average by watercourse with 69% OE, while Lower Chedakuz had the highest at 88%. Low OE in Creek 661 can be attributed to abundant woody debris and thick overhanging vegetation while abundant aquatic vegetation hindered visibility in Lower Chedakuz Creek (Photo 12 and Photo 13).

Table 4-4 summarizes the escapement estimates and confidence intervals generated for each of the AUC models for Davidson Creek and Creek 661. The GAUC estimates were slightly greater that the TAUC estimates in both creeks.

Table 4-3. Observer efficiency by survey section

Waterbody	*Survey Section*	*Observer Efficiency (%)*		
		Min	*Max*	*Average*
Davidson Creek	DC-1A-KO	75	90	86

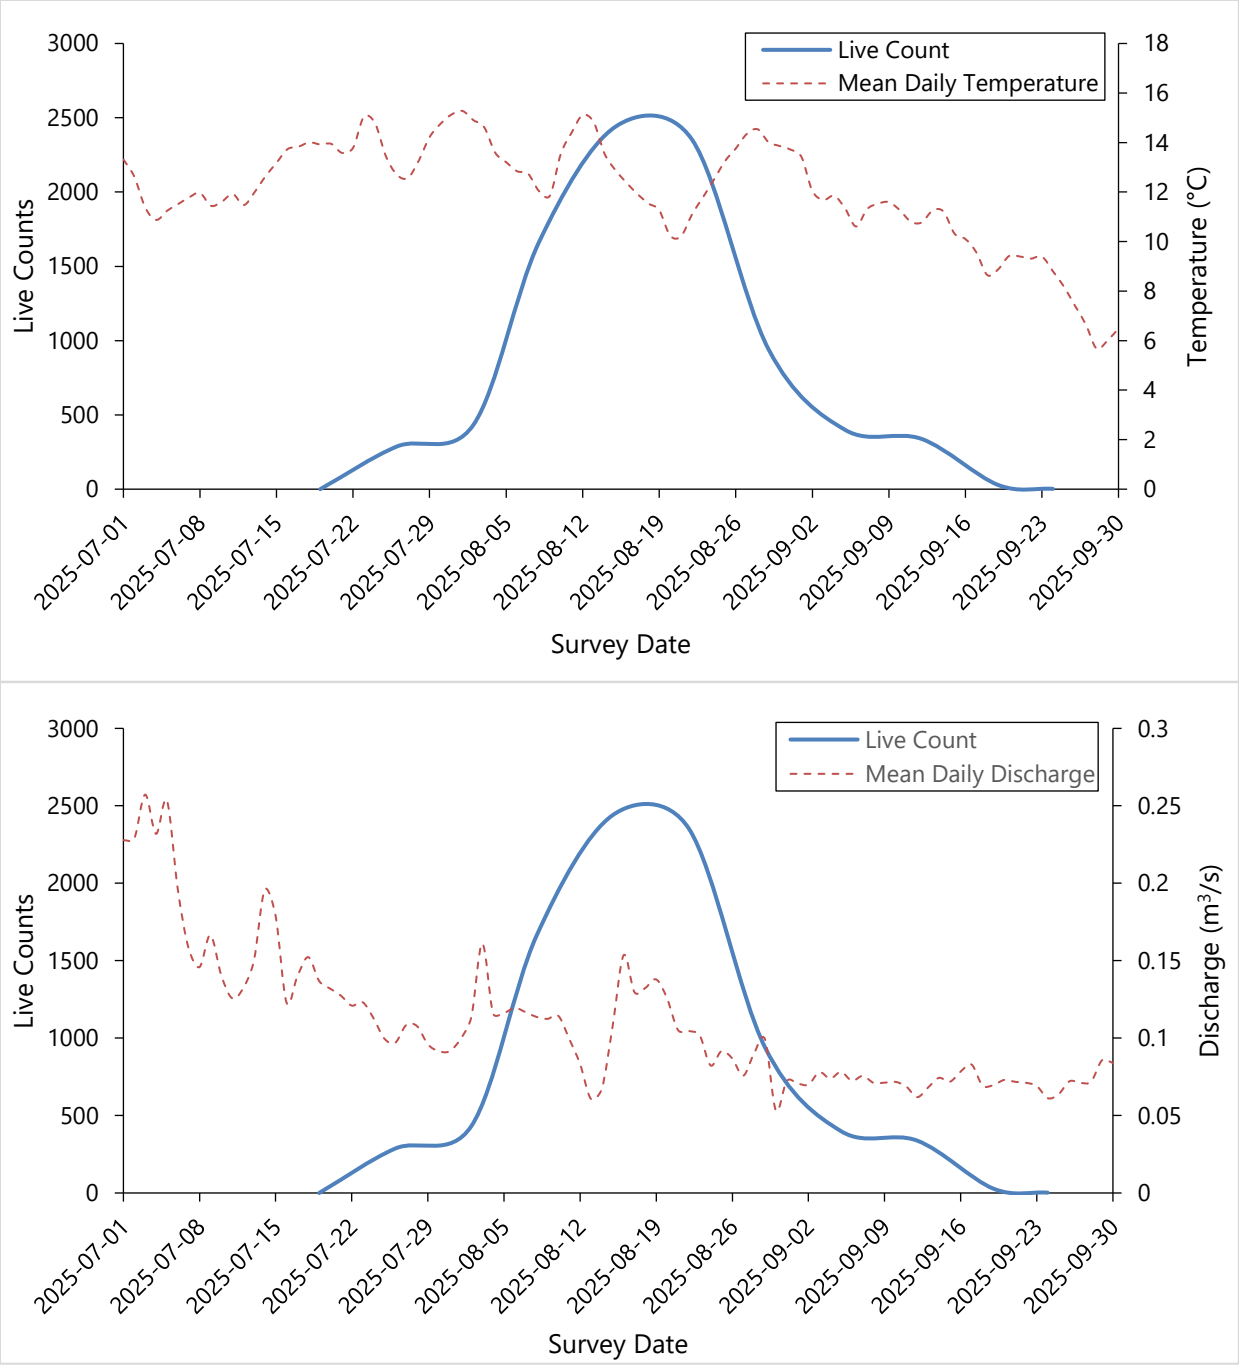
Davidson Creek	TAUC#	6,193	2,161	1,958	10,429
Creek 661	GAUC	1,806	167	1,479	2,134
Creek 661	TAUC	1,763	119	1,529	1,996

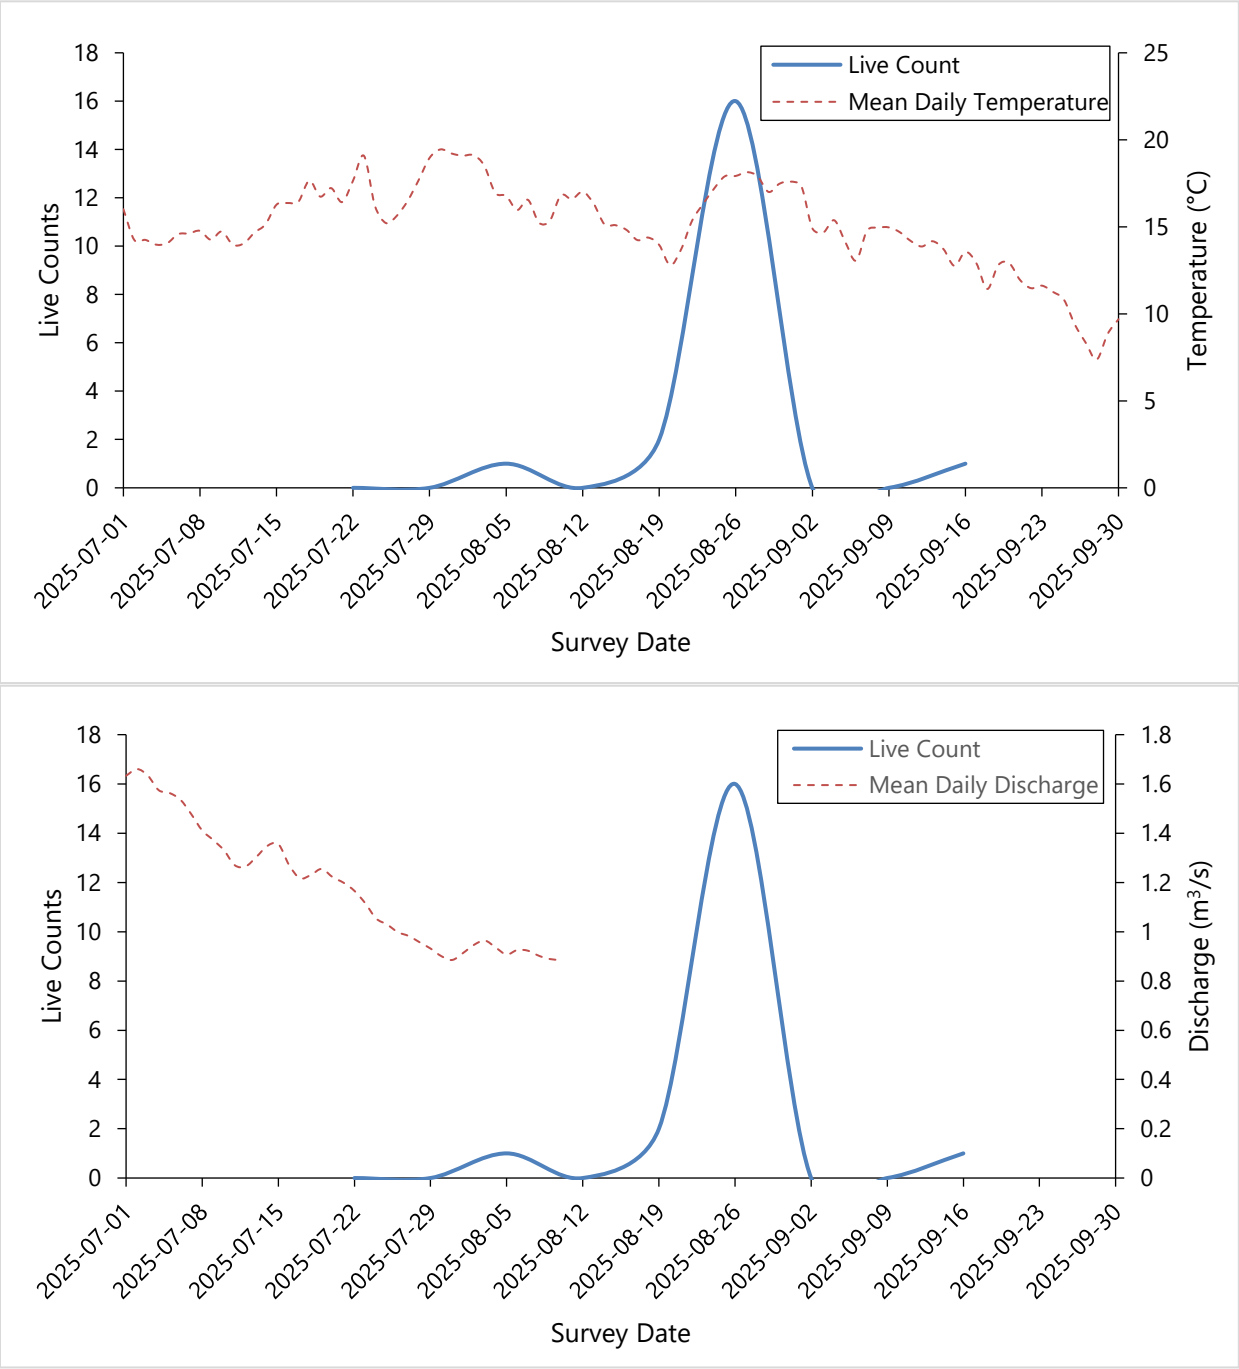
Kokanee live counts were plotted against temperature and discharge data for the entire spawning period for Davidson Creek, Lower Chedakuz Creek, and Creek 661 (Figure 4-6, Figure 4-7, and Figure 4-8). Temperature and hydrometric station locations are depicted in Figure 2-1. In Davidson Creek, temperature data was collected from the ST-08_DEEP location as it was the closest temperature station to the surveyed sections, and discharge data was collected from the DC-05 hydrometric station. Temperature and discharge data were both collected at the CC-15 station in Lower Chedakuz Creek, and from the 661-09 station in Creek 661. Discharge data for Lower Chedakuz Creek were not available beyond August 10, 2025.

Figure 4-6. Kokanee live counts in Davidson Creek compared to temperature (above) and discharge (below)



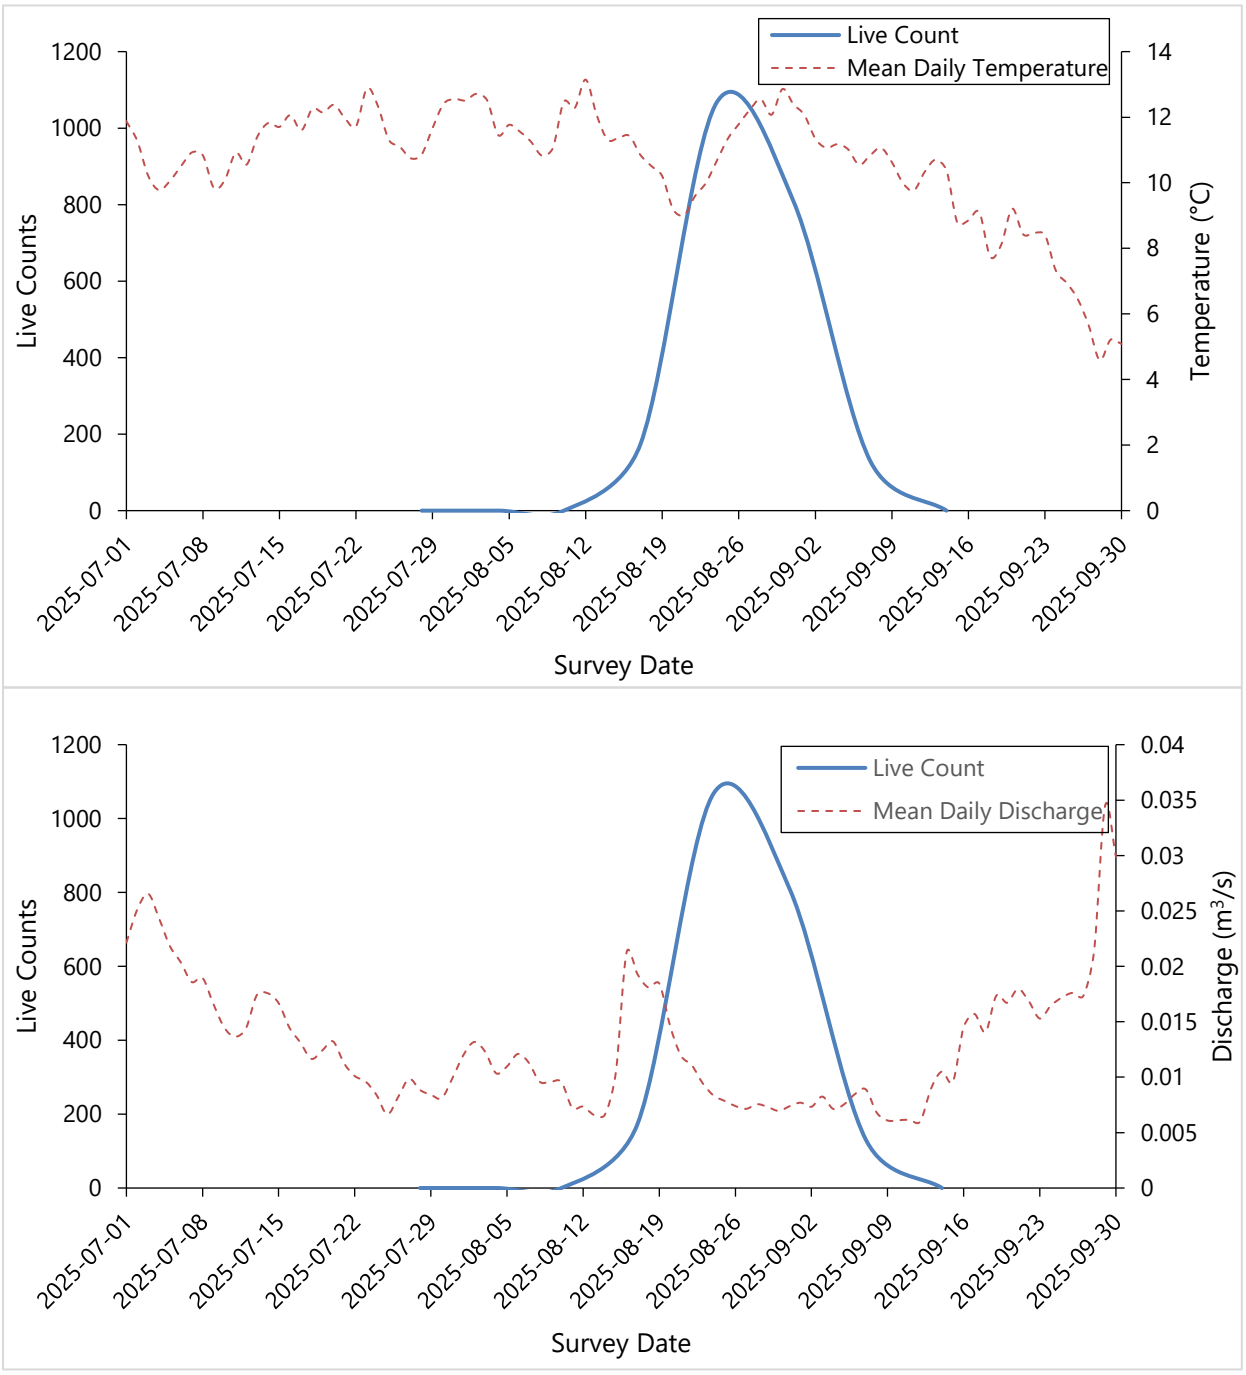
Note: Mean daily water temperature data was collected from the ST-08_DEEP temperature station provided by BW Gold and discharge data was collected from the DC-05 hydrometric station provided by Knight Piésold

Figure 4-7. Kokanee live counts in Lower Chedakuz Creek compared to temperature (above) and discharge (below)



Note: Mean daily water temperature data was collected from the CC-15 temperature station provided by BW Gold and discharge data was collected from the CC-15 hydrometric station provided by Knight Piésold. Discharge data beyond August 10, 2025 not available.

Figure 4-8. Kokanee live counts in Creek 661 compared to temperature (above) and discharge (below)



Note: Mean daily water temperature data was collected from the 661-09 temperature station provided by BW Gold and discharge data was collected from the 661-09 hydrometric station provided by Knight Piésold

4.2.3 Redd Abundance

Peak redd counts and densities are provided in Table 4-5. Peak redd counts were highest in Middle Chedakuz Creek at CC-05B-KO with 120 redds, followed by Davidson Creek at DC-1A-KO, and CC-02A-KO with 64 and 47 redds, respectively. No redds were observed in DC-3-KO, DC-4-KO, 661-20F-KO, 661-20G-KO or 661-20H due to large, impassable beaver dams at the upper extent of DC-2-KO, and mid way in 661-20E-KO.

When comparing redd density, CC-05B-KO, DC-1A-KO, and CC-02A-KO had the highest peak density of redds per 100 m^2 at 2.51, 1.56, and 0.99, respectively (Table 4-5). All Kokanee bearing sections in Davidson Creek showed a bimodal distribution in redd densities, peaking around August 29, 2025 and a second peak around September 19 (Figure 4-9). In Creek 661, 661-20D-KO had the highest peak density around September 7, 2025 with 0.56 redds/100m^2 followed by 661-20A-KO and 661-20B-KO peaking around September 12, 2025 with 0.51 and 0.49 redds/100m^2, respectively (Figure 4-10). Lower Chedakuz had the lowest redd density with CC-15B-KO peaking at 0.05 redds/100m^2 (Figure 4-11). In Middle Chedakuz Creek, CC-05B-KO had the highest peak overall with 2.51 redds/100m^2 around September 20, 2025 (Figure 4-12). The spatial distribution and the abundance of Kokanee redds for each watershed are provided in Figure 4-13 to Figure 4-16.

Peak redd density at all creeks occurred in September. When comparing Kokanee density to redd density, it appears that peak redd density lags by approximately two to three weeks, suggesting the average length of time for Kokanee to pair up and construct a redd in these sections may be two to three weeks.

Table 4-5. Peak count and density of Kokanee redds by survey section

Waterbody	*Survey Section*	*Peak Redd Count*	*Peak Redd Density (# /100 m²)*

File Path: G:\10 Projects\12476-Blackwater_Gold_AEMP_3.14and3.16_FUP\12476 Blackwater_Gold_AEMP_3.14and3.16_FUP\ aprx\12476_Fig4-_KO_REDDS_251201

4.2.4 Length and Age at 100% maturity

In total, 110 dead Kokanee were sampled for postorbital-hypural length, and 108 Kokanee were measured for fork length (Table 4-6). Discrepancy in the number of Kokanee sampled for each length metric was attributed to fin wear and decay of the caudal fin, such that fork length could no longer be accurately determined for two of the fish, and measurements were not obtained from one additional fish.

Minimum, maximum, and mean (± 1 SD) fork lengths and postorbital-hypural lengths, pooled by waterbody, with Middle Chedakuz Creek further separated into sections (CC-02 and CC-05) are presented in Table 4-6.

Mean fork and mean postorbital-hypural length between the control (CC-02A-KO and CC-02B-KO) and impact sites could not be determined due to only a single carcass measurement in both sections of CC-02. A comparison between Davidson Creek (DC-1A-KO and DC-1B-KO) and Middle Chedakuz Creek (CC-05A-KO, CC-05B-KO, and CC-02A-KO) found mean fork length to be slightly greater in Davidson Creek Kokanee with marginally significant differences (p = 0.046), whereas no significant difference was found for mean postorbital-hypural lengths (p = 0.127).

Table 4-6. Mean fork length and mean postorbital-hypural length by watercourse and sex of fish

A total of 76 otolith samples were collected from adult Kokanee carcasses and submitted for laboratory age analysis. Age-3 and age-4 fish were equally split with 38 otolith samples collected for each age. No otolith samples were collected from Creek 661. In Middle Chedakuz Creek, a total of 27 otolith samples were collected. At CC-05B-KO, age-3 fish were more numerous than age-4, and more age-4 fish were found at CC-05A-KO compared to age-3 fish (Table 4-7).

Table 4-7. Number of age structures collected for each age class by survey section

Watercourse	*Section*	*Age 3+*	*Age 4+*	*Total*

	CC-05A-KO	2	6	8
	CC-05B-KO	12	6	18
All		**38**	**38**	**76**

The slightly longer Kokanee in Davidson Creek compared to Middle Chedakuz Creek could also be seen across both age classes (
Figure 4-17). Mean fork and postorbital-hypural length with standard deviations by survey section and fish age class are presented in Table 4-9.

Fork length and postorbital-hypural length frequency distributions in Davidson Creek and Middle Chedakuz Creek are presented in Figure 4-18 through Figure 4-21, and Table 4-8.

Statistical comparisons for length at age between survey sections and/or watercourses could not be determined due to the insufficient number of otolith collections.

Table 4-8. Mean fork length and mean postorbital-hypural length by age class by watercourse

4.3 Mesohabitat Relative Abundance

Mesohabitat assessments were completed at a total of 14 survey sections. The number of discrete habitat units encountered within each section ranged from seven to 131, with detailed habitat assessments collected for a subset of 20% to 67% of each habitat type (Table 4-10 and Table 4-11).

When considering percentage of habitat units overall, glides were the dominant primary habitat type in all but two survey sections, with riffles and pools as the most dominant in CC-02B-KO and DC-4-KO, respectively (Figure 4-22). When factoring in habitat unit length, glides were the dominant habitat type in all survey sections with the exception of DC-3-KO, where pools were the primary habitat unit (Figure 4-23). The first habitat unit encountered in DC-3-KO was immediately upstream of a large beaver dam, which caused extensive pooling, accounting for a total length of 870 m.

Detailed habitat assessments collected within each survey section displayed a range of dominant and subdominant substrate types, varying from boulders to fines, with gravels as the dominant substrate in eight of 14 sections. Survey section CC_3.16, immediately downstream of Tatelkuz Lake, had the largest average bankfull and wetted width at 20.93 m and 18.36 m, respectively, while 661-20B-KO had the smallest average bankfull width at 3.38 m (Table 4-11).

Table 4-10. Summary of mesohabitat data collected during FHAP surveys

Survey Section	Number of Habitat Units	Number of Glides	Number of Pools	Number of Riffles	Percent Glide (%)	Percent Pool (%)	Percent Riffle (%)	Percent Glide by Section Length	Percent Pool by Section Length	Percent Riffle by Section Length

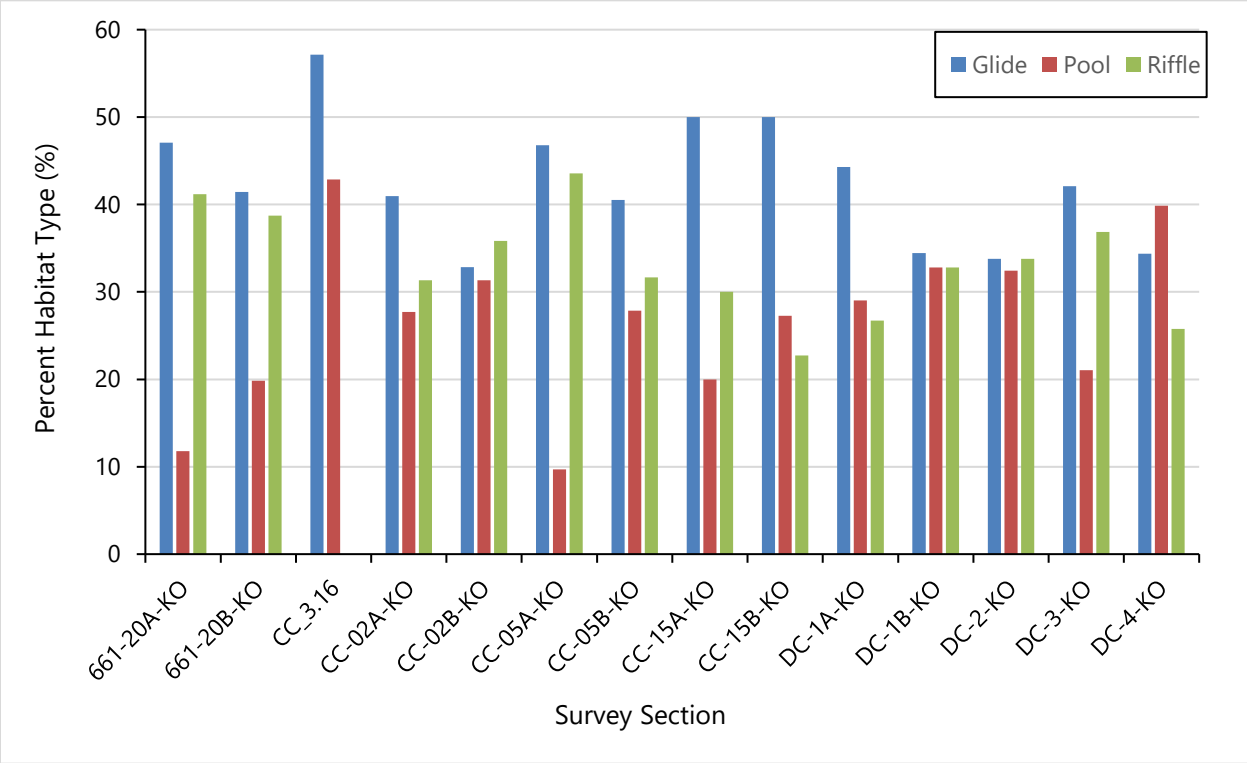

Figure 4-23. Percentage of habitat unit type by length

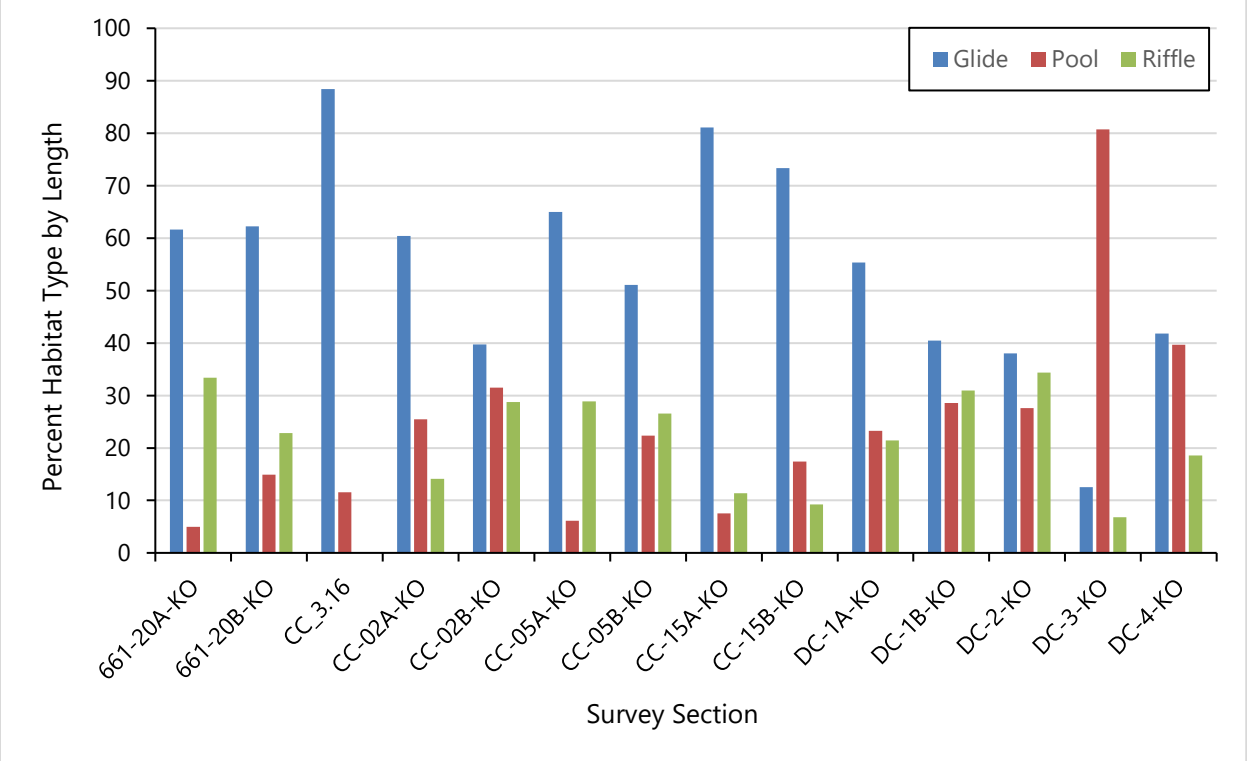

4.4 Substrate Composition

Maximum, minimum, mean, and standard deviation values for the two-particle size analyses completed by survey section are provided in Table 4-12. Particle size distribution curves for each of the substrate samples collected are provided in Appendix 3.

The percentage of fines less than 0.85 mm was greatest at 661-20B-KO with a mean of 10.34 ± 7.24% and smallest at CC-02A-KO with a mean of 7.58 ± 3.87%. The geometric mean diameter was greatest at CC-05A-KO, and smallest at CC-02B-KO with means of 12.97 ± 3.69 mm and 9.34 ± 2.33 mm, respectively.

A Shapiro-Wilk test showed that the geometric mean substrate diameter was normally distributed ($p > 0.05$) within each section, and within each site. The Kruskal-Wallis found that there was no significant difference among the watercourses (e.g., CC-02 compared to CC-05 [$p = 0.3791$] or CC-02 compared to 661-20 [$p = 0.6707$]; Figure 4-24); however, there was a significant difference ($p = 0.0197$) between the control site sections (i.e., CC-02A-KO and CC-02B-KO; Table 4-13).

Table 4-12. Maximum, minimum, mean, and standard deviation for the two-particle size analysis completed by survey section

Survey Section	*% <0.85 mm*				*Geometric Mean Diameter*			
	Max	**Min**	**Mean**	**SD**	**Max**	**Min**	**Mean**	**SD**
661-20A	14.97	2.84	8.93	3.70	16.14	6.30	10.37	3.46
661-20B	28.63	3.61	10.34	7.24	14.87	2.64	9.91	3.94
CC-02A	15.95	3.11	7.58	3.87	18.27	7.14	12.34	3.47

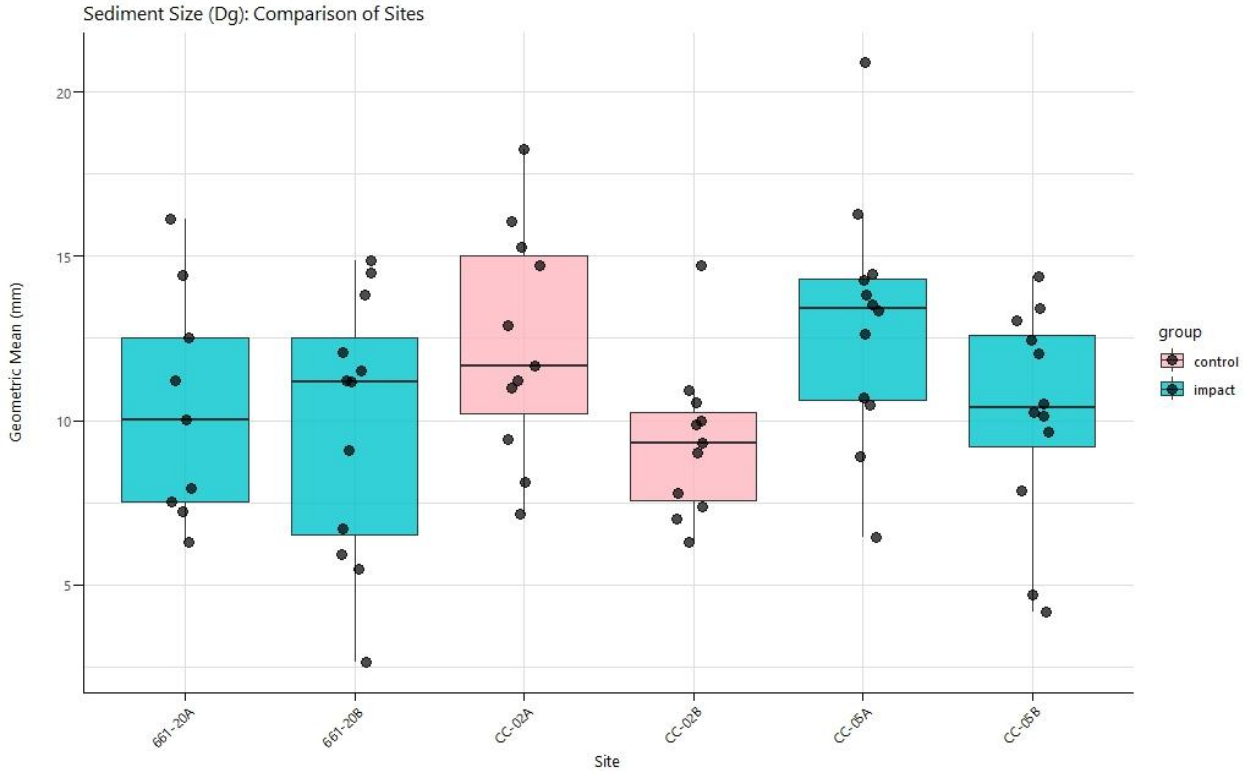
Table 4-13. Chi-Squared test results comparing substrate geometric mean diameter by survey section

Survey Section	Chi-Squared Value (χ^2)	p-value	Significance ($p < 0.05$)
CC-02A-KO vs. CC-02B-KO	5.434	0.0197	Yes
CC-02 vs. CC-05	0.774	0.3791	No
CC-02 vs. 661-20	0.181	0.6707	No

Figure 4-24. Geometric mean diameter (with 95% confidence limits) of substrate by survey section



4.5 Underwater Camera

A total of 23,332 videos were recorded over the 68 days the camera was deployed, of which 5,246 videos contained images of identifiable fish. These videos documented a total of 419 Kokanee, with 245 observed heading upstream, 148 Kokanee observed heading downstream and 26 where the direction of movement could not be determined. The maximum number of Kokanee observed moving upstream in a single day was 33, occurring on August 11, 2025 (Figure 4-25). This coincided with a peak in Kokanee observations during the visual bank walk survey on August 15, 2025 (Figure 4-3).

Of the 419 Kokanee observed in videos, 50.4% were captured during daylight hours between 09:00 and 16:59, 23.1% were captured in the evening between 17:00 – 19:29 and 15.2% were captured in the morning between 06:00 and 08:59 (Figure 4-26). Although the camera was equipped with infrared lighting to detect fish in low light conditions, the lowest number of Kokanee were observed during nighttime conditions, with 11.2% of the observations between 19:30 and 05:59. Historically, the vast majority of Kokanee have been observed to migrate during crepuscular periods (dusk/dawn) which in 2025 occurred when fish were unable to be properly viewed due to low light settings. Camera efficiencies were made prior to the 2025 sampling period, increasing the number of nighttime videos recorded in 2025 in comparison to 2024; however, the number of nighttime Kokanee observations were significantly lower than years prior to 2024. Based on the escapement estimates for Davidson Creek, the underwater camera was only able to capture a small percentage of the migrating Kokanee.

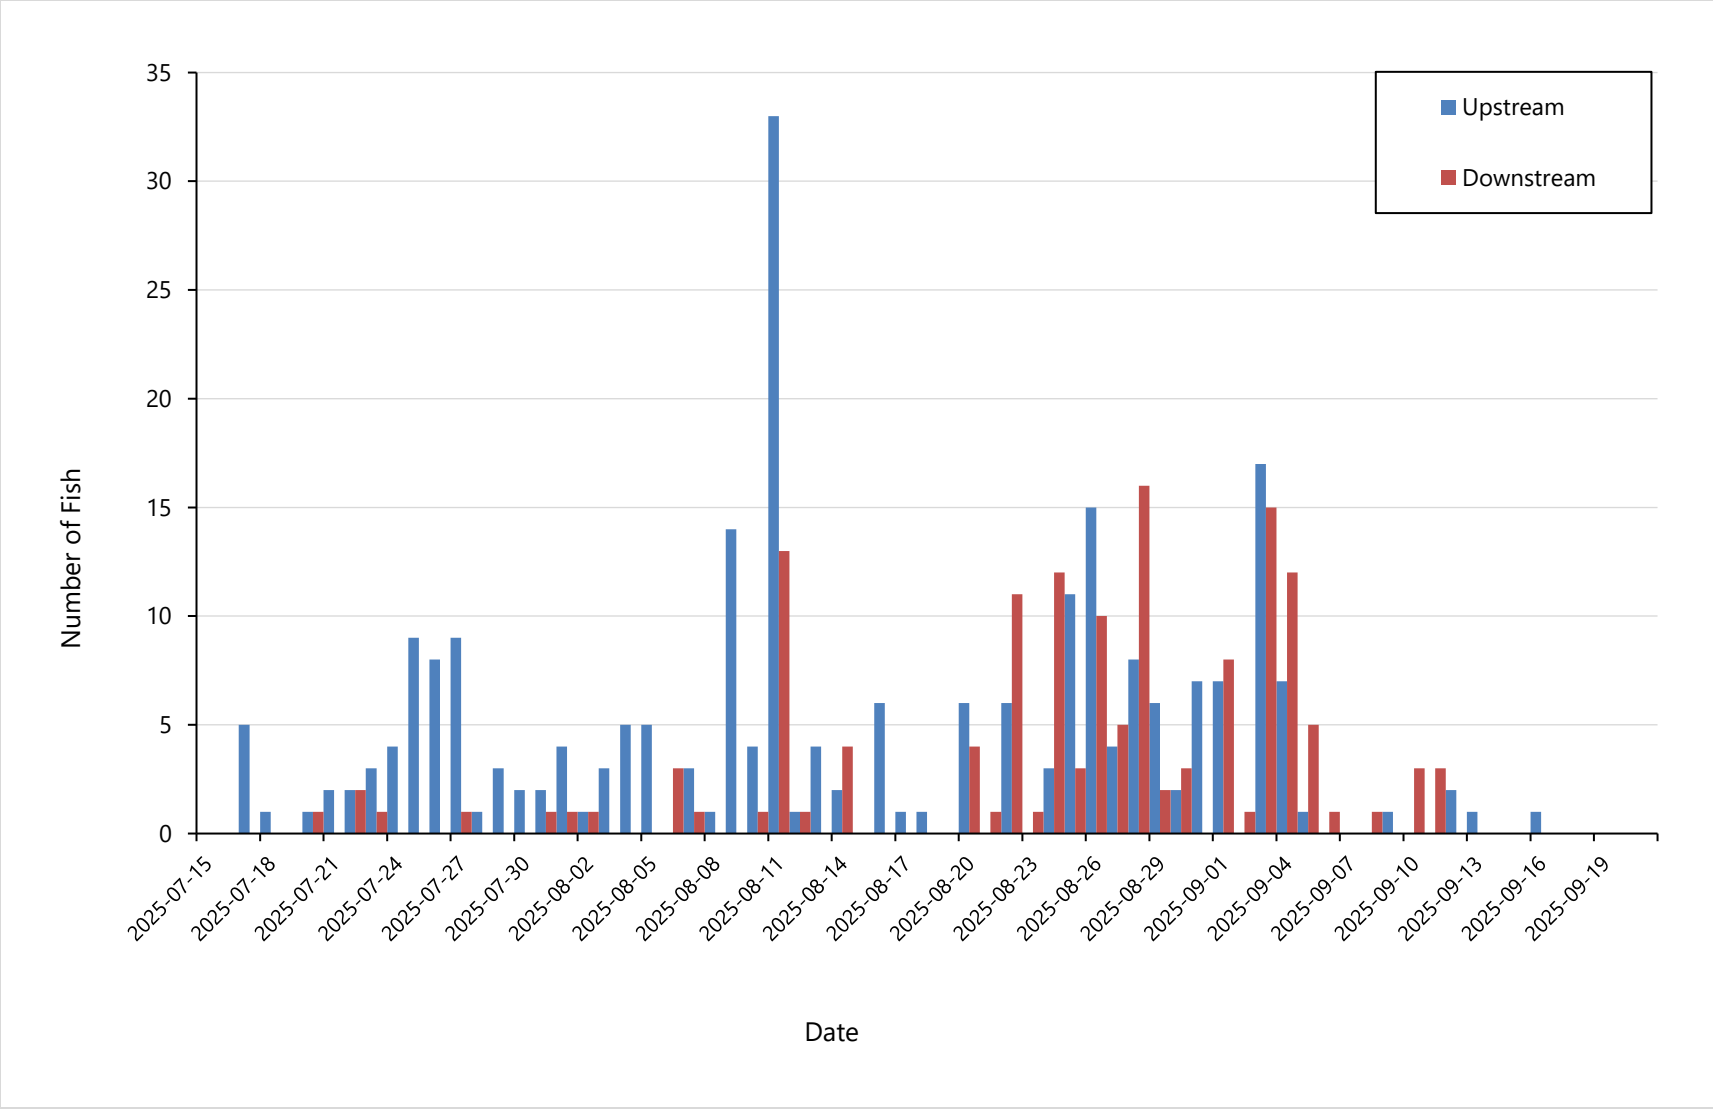

Figure 4-26. Davidson Creek underwater camera Kokanee observations by time of day

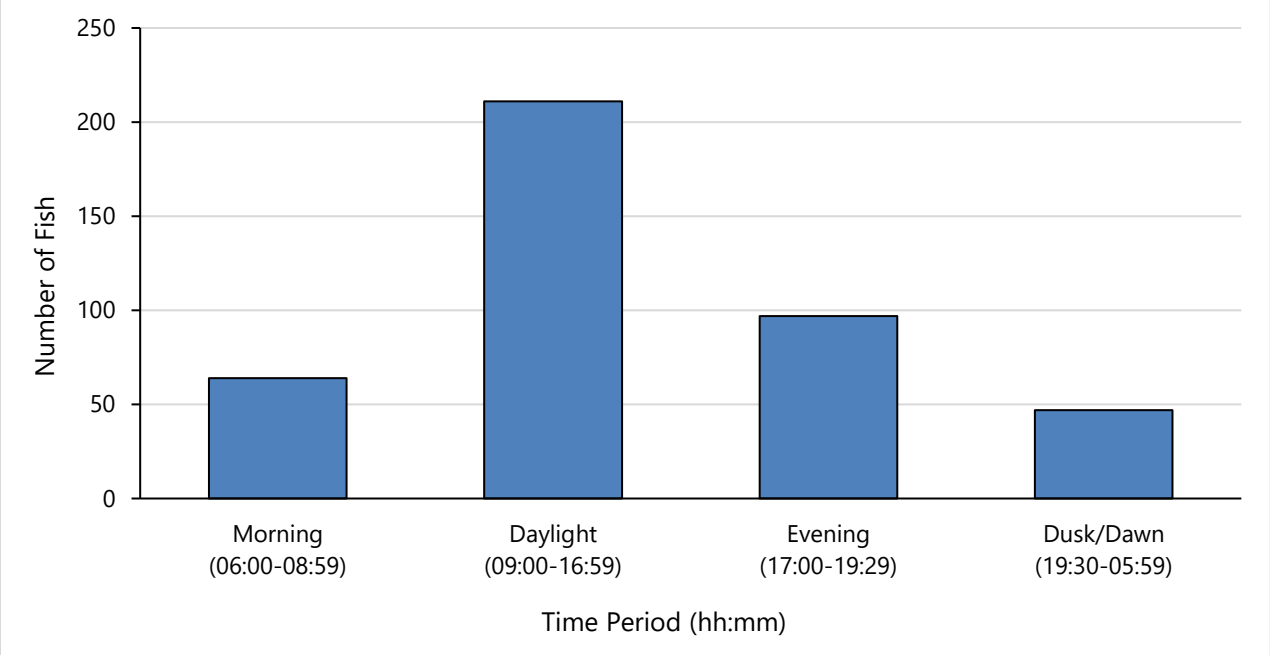

5.0 Closing

The 2025 Kokanee Spawner Program was successful in collecting and assessing data during the first year of Mine operations relating to the long-term monitoring requirements under the AEMP, and two Follow-up Programs for Condition 3.14 and Condition 3.16. Field work included visual spawner and redd surveys, water quality measurements, substrate sampling, FHAP surveys, carcass measurements, otolith collection, and underwater camera deployment. Sampling was conducted over a 69-day period at a total of 20 survey sites throughout Davidson Creek, Chedakuz Creek, and Creek 661 from mid July to late September.

The data collected in 2025 will contribute to evaluating Davidson Creek, Chedakuz Creek, and Creek 661 with respect to mitigation effectiveness and to detect Mine-related effects under the FUP for Condition 3.14, the FUP for Condition 3.16, and the AEMP. The results of the 2025 Kokanee Spawner Program will be used in subsequent reports to address assessment endpoints, implement planned mitigation measures, and inform management decisions.

AEMP	Chedakuz Creek	CC-05B-KO	2025-08-03	BRADEN ARSENAULT, JOEL GUSTAVSON	13	50	Calm	None	No Kokanee detected.
AEMP	Chedakuz Creek	CC-05A-KO	2025-08-03	BRADEN ARSENAULT, JOEL GUSTAVSON	23	25	Calm	None	Well flagged trails, easy navigating and good view of the stream.
AEMP	Creek 661	661-20A-KO	2025-08-04	CHRISTIAN CARNEVALE, TATE FOWLER (BWG)	17	25	Calm	None	
AEMP	Creek 661	661-20B-KO	2025-08-04	CHRISTIAN CARNEVALE, TATE FOWLER (BWG)	22	0	Calm	None	
AEMP	Creek 661	661-20C-KO	2025-08-04	BRADEN ARSENAULT, JOEL GUSTAVSON	10	0	Calm	None	Lots of large woody debris across the stream and criss crossed on the bank. Crown/vegetation closure makes viewing limited in certain areas.
AEMP	Creek 661	661-20D-KO	2025-08-04	BRADEN ARSENAULT, JOEL GUSTAVSON	15	0	Calm	None	Lots of large woody debris and thick vegetation stream side. Slow going due to terrain.
AEMP	Chedakuz Creek	CC-15B-KO	2025-08-05	BRADEN ARSENAULT, JOEL GUSTAVSON	15	75	Calm	None	Aquatic plant growth and silty bottoms were abundant in the stream.
AEMP	Chedakuz Creek	CC-15A-KO	2025-08-05	BRADEN ARSENAULT, JOEL GUSTAVSON	16	100	Calm	Intermittent Rain Shower	Thick aquatic vegetation throughout the stream with a sandy/silty substrate. Some gravel and cobble present. No Kokanee observed.
Condition 3.16	Chedakuz Creek	CC_3.16	2025-08-05	BRADEN ARSENAULT, JOEL GUSTAVSON	20	100	Calm	Light Rain	
AEMP	Creek 661	661-20E-KO	2025-08-06	BRADEN ARSENAULT, MAGGIE LENART (BWG)	12	75	Calm	Intermittent Rain Shower	Lots of blow down present. Rain picked up as survey progressed.
AEMP	Creek 661	661-20F-KO	2025-08-06	BRADEN ARSENAULT, MAGGIE LENART (BWG)	14	100	Light	Light Rain	Rain created slick/slippery conditions slowing down the survey. Lots of large woody debris/deadfall present. Stream had lots of cobble present but has some beaver dam obstructions.
AEMP	Creek 661	661-20G-KO	2025-08-07	BRADEN ARSENAULT, QUAIN SULIN (BWG)	11	0	Calm	None	Easier going in the first section of the bank walk, vegetation and woody debris become dense in the middle section. The final ~300 meters becomes easier going. Beaver dam split stream
AEMP	Creek 661	661-20H-KO	2025-08-07	BRADEN ARSENAULT, QUAIN SULIN (BWG)	15	75	Calm	None	Heavy dead fall (particularly on the ending half).
Condition 3.14	Davidson Creek	DC-3-KO	2025-08-08	CHRISTIAN CARNEVALE, MAGGIE LENART (BWG)	15	100	Calm	None	
Condition 3.14	Davidson Creek	DC-4-KO	2025-08-08	CHRISTIAN CARNEVALE, MAGGIE LENART (BWG)	20	100	Calm	Light Rain	
AEMP	Chedakuz Creek	CC-05B-KO	2025-08-09	CHRISTIAN CARNEVALE, JOEL GUSTAVSON	15	100	Calm	Light Rain	
AEMP	Chedakuz Creek	CC-05A-KO	2025-08-09	CHRISTIAN CARNEVALE, JOEL GUSTAVSON	17	100	Calm	None	
Condition 3.14 / AEMP	Davidson Creek	DC-1A-KO	2025-08-08	BRADEN ARSENAULT, JOEL GUSTAVSON	11	100	Moderate	None	Open pasture with alder and larger trees around stream. Easy walking and great view-ability. Cattle present.
Condition 3.14	Davidson Creek	DC-1B-KO	2025-08-08	BRADEN ARSENAULT, JOEL GUSTAVSON	14	100	Moderate	Light Rain	Slightly more closed in then DC-1A. Majority of the terrestrial vegetation and canopy cover is alder. Cattle present
Condition 3.14 / AEMP	Davidson Creek	DC-2-KO	2025-08-08	BRADEN ARSENAULT, JOEL GUSTAVSON	14	100	Moderate	Light Rain	Progressively more terrestrial habitat by comparison to DC-1A and B.
AEMP	Chedakuz Creek	CC-02A-KO	2025-08-09	BRADEN ARSENAULT, MAGGIE LENART (BWG)	10	100	Light	None	Habitat is a mature stand of conifers with a cut block adjacent which have both had a wildfire come through. Lots of standing snags/ large woody debris and blow down present.
AEMP	Chedakuz Creek	CC-02B-KO	2025-08-09	BRADEN ARSENAULT, MAGGIE LENART (BWG)	12	100	Moderate	Light Rain	Habitat consists of mature conifers with a mossy ground and shrubs around the creek.
AEMP	Creek 661	661-20C-KO	2025-08-10	CHRISTIAN CARNEVALE, JOEL GUSTAVSON	15	100	Light	None	
AEMP	Creek 661	661-20D-KO	2025-08-10	CHRISTIAN CARNEVALE, JOEL GUSTAVSON	20	50	Moderate	None

AEMP	Creek 661	661-20D-KO	2025-08-24	CAROLINE FARKAS, KIM KAISER (BWG)	28	0	Calm	None	
AEMP	Creek 661	661-20E-KO	2025-08-25	CAROLINE FARKAS, SYDNEY REIMER	15	0	Calm	None	No Kokanee observed upstream of first beaver dam
AEMP	Creek 661	661-20F-KO	2025-08-25	CAROLINE FARKAS, SYDNEY REIMER	24	0	Calm	None	
AEMP	Chedakuz Creek	CC-15B-KO	2025-08-26	CAROLINE FARKAS, SYDNEY REIMER	12	0	Calm	None	
AEMP	Chedakuz Creek	CC-15A-KO	2025-08-26	CAROLINE FARKAS, SYDNEY REIMER	20	0	Calm	None	
Condition 3.16	Chedakuz Creek	CC_3.16	2025-08-26	CAROLINE FARKAS, SYDNEY REIMER	32	0	Calm	None	
Condition 3.14 / AEMP	Davidson Creek	DC-1A-KO	2025-08-29	BRADEN ARSENAULT, ETHAN ROACH (BWG)	22	0	Calm	None	Smokey conditions. Substantial number of morts observed, lots of spawning activity.
Condition 3.14	Davidson Creek	DC-1B-KO	2025-08-29	BRADEN ARSENAULT, ETHAN ROACH (BWG)	26	0	Calm	None	Substantial amount of morts and lots of spawning activity.
Condition 3.14 / AEMP	Davidson Creek	DC-2-KO	2025-08-29	BRADEN ARSENAULT, ETHAN ROACH (BWG)	26	0	Calm	None	Thicker vegetation compared to the DC-1 transects. Substantial spawning activity on the front half of the transect.
Condition 3.14	Davidson Creek	DC-3-KO	2025-08-29	JOEL GUSTAVSON, ADAM SCOTT (BWG)	19	0	Calm	None	Beaver dam at start of DC-03 - barrier for fish passage. One wetted width was recorded at 800m. Hazy viewing to do smoke in the air.
Condition 3.14	Davidson Creek	DC-4-KO	2025-08-29	JOEL GUSTAVSON, ADAM SCOTT (BWG)	28	25	Calm	None	No fish observed. Hazy viewing due to smoke in the air. Woody debris abundant in upper portions.
AEMP	Chedakuz Creek	CC-02A-KO	2025-08-30	BRADEN ARSENAULT, DEANNA KETLO (MARMAC)	21	0	Light	None	Eagles have made a presence on the site (lots of white wash present).
AEMP	Chedakuz Creek	CC-02B-KO	2025-08-30	BRADEN ARSENAULT, DEANNA KETLO (MARMAC)	25	0	Calm	None	Eagle predation is prevalent on the site. Kokanee activity tapers off towards the end of the stream section.
AEMP	Chedakuz Creek	CC-05A-KO	2025-08-30	JOEL GUSTAVSON, BRADEN ARSENAULT	17	0	Calm	None	Mortalities were abundant but not retrievable due to vast amount of fish and location of most mortalities (bottom of deep pools). Hazy viewing due to smoke in the air.
AEMP	Chedakuz Creek	CC-05B-KO	2025-08-30	JOEL GUSTAVSON, BRADEN ARSENAULT	26	0	Calm	None	Hazy viewing due to smoky conditions. Morts were observed but were not retrievable as they were in deep pools with other holding Kokanee still in them.
AEMP	Creek 661	661-20A-KO	2025-08-31	JOEL GUSTAVSON, BRADEN ARSENAULT	15	0	Calm	None	Extremely smoky. No blue sky visible.
AEMP	Creek 661	661-20B-KO	2025-08-31	JOEL GUSTAVSON, BRADEN ARSENAULT	24	0	Calm	None	Slightly Smokey. Many Kokanee observed with lesions on the body.
AEMP	Creek 661	661-20C-KO	2025-08-31	BRADEN ARSENAULT, DEANNA KETLO (MARMAC)	14	100	Calm	None	Cloud cover 100% to account for heavy smoke. Wetted width and bank width are very similar but the overall water level is shallow. The creek is tangled with blow down and large woody debris making it difficult for both fish passage and lowering observer efficiency. Beaver dams previously recorded are adversely affecting water flow and fish passage. Majority of the Kokanee observed have markings/damage from head to dorsal.
AEMP	Creek 661	661-20D-KO	2025-08-31	BRADEN ARSENAULT, DEANNA KETLO (MARMAC)	24	0	Calm	None	Smoke mentioned on 661-20C survey lifted. Trail is bucked past the bridge. Downstream of the bridge has lots of vegetation and woody debris over the creek.
AEMP	Creek 661	661-20E-KO	2025-09-01	BRADEN ARSENAULT, JOEL GUSTAVSON	13	0	Calm	None	Light smokey haze that cleared as the day went on. The bucked trail veers off the stream a noteable distance. Specifically at ~700 till the end the bucked trail follows the wrong creek. Trail overall is in much better condition than previous visits.
AEMP	Creek 661	661-20F-KO	2025-09-01	BRADEN ARSENAULT, JOEL GUSTAVSON	24	0	Light	None	
Condition 3.16	Chedakuz Creek	CC_3.16	2025-09-02	BRADEN ARSENAULT, JOEL GUSTAVSON	14	100	Calm	None	Shallow water with minimal flow. No Kokanee observed.
AEMP	Chedakuz Creek	CC-15B-KO	2025-09-02	BRADEN ARSENAULT, JOEL GUSTAVSON	20	100	Calm	None	Nothing notable from the previous visits.
AEMP	Chedakuz Creek	CC-15A-KO	2025-09-02	BRADEN ARSENAULT, JOEL GUSTAVSON	23	100	Calm	None	Lots of matted aquatic vegetation. Low DO levels.
AEMP	Creek 661	661-20G-KO	2025-09-03	BRADEN ARSENAULT, JOEL GUSTAVSON	12	75	Calm	None	Smokey conditions. Water is low, lots of areas with exposed high spots/islands within the stream. Still some deep pools present.
AEMP	Creek 661	661-20H-KO	2025-09-03	BRADEN ARSENAULT, JOEL GUSTAVSON	22	25	Calm	None	
AEMP	Chedakuz Creek	CC-05A-KO	2025-09-04	BRADEN ARSENAULT, JOEL GUSTAVSON	20	0	Calm	None	
Condition 3.14 / AEMP	Davidson Creek	DC-1A-KO	2025-09-05	BRADEN ARSENAULT, JOEL GUSTAVSON	9	100	Calm	None	
Condition 3.14	Davidson Creek	DC-1B-KO	2025-09-05	BRADEN ARSENAULT, JOEL GUSTAVSON	16	100	Calm	None	Otter observed towards the end point of survey
Condition 3.14 / AEMP	Davidson Creek	DC-2-KO	2025-09-05	BRADEN ARSENAULT, JOEL GUSTAVSON	18	100	Calm	None	Heavy otter sign predating on kokanee.
AEMP	Chedakuz Creek	CC-02A-KO	2025-09-06	BRADEN ARSENAULT, SHANE BOYD (MARMAC)	9	75	Calm	None	Kokanee activity has slowed down significantly since the last visit. Old Redds are still visible and some-what clean but many have become inactive for spawning activity. Very smokey conditions on this survey, extra time was taken to view all areas to ensure nothing was missed.
AEMP	Chedakuz Creek	CC-02B-KO	2025-09-06	BRADEN ARSENAULT, SHANE BOYD (MARMAC)	16	100	Calm	None	Smokey conditions. Kokanee activity has tapered off from previous visit.
AEMP	Chedakuz Creek	CC-05B-KO	2025-09-06	JOEL GUSTAVSON, BRENT HERON (MARMAC)	9	0	Calm	None	Extreme smoke conditions made it completely overcast. Viewing was less favourable dude to the glare on the water caused by the smoke. An otter was observed during the survey and lots of fecal matter with fish scales was present.
AEMP	Chedakuz Creek	CC-05A-KO	2025-09-06	JOEL GUSTAVSON, BRENT HERON (MARMAC)	21	0	Calm	None	Extreme smoke conditions made it completely overcast. Viewing was less favourable due to the glare on the water caused by the smoke.
AEMP	Creek 661	661-20A-KO	2025-09-07	JOEL GUSTAVSON, BRENT HERON (MARMAC)	12	25	Calm	None	Some cloud coverage and some smoke coverage but mostly clear conditions. Significantly less water than previous week and large decrease in the number of Kokanee observed.
AEMP	Creek 661	661-20B-KO	2025-09-07	JOEL GUSTAVSON, BRENT HERON (MARMAC)	24	25	Calm	None	Slight cloud cover during middle of the afternoon but clearing to no cover. Significantly less water than previous.
AEMP	Creek 661	661-20C-KO	2025-09-07	BRADEN ARSENAULT, SHANE BOYD (MARMAC)	11	0	Calm	None	The stretch between 400-800 meters has heavy crown closure and large woody debris making observer efficiency lower. Bear tracks observed near Kokanee Redds previously recorded.
AEMP	Creek 661	661-20D-KO	2025-09-07	BRADEN ARSENAULT, SHANE BOYD (MARMAC)	19	0	Calm	None	Bear sign noted near previously marked Redds. Kokanee activity has slowed down significantly since previous visit.

Table A2-2. Survey Information

Program	Waterbody	Site	Survey Date	Crew Names	Air Temperature (°C)	Cloud Cover (%)	Wind	Precipitation	Comments
AEMP	Creek 661	661-20E-KO	2025-09-08	BRADEN ARSENAULT, SHANE BOYD (MARMAC)	12	0	Light	None	No Kokanee observed.Water level is shallow but majority of the stream remains wetted. The pools present are still holding a fair amount of water.
AEMP	Creek 661	661-20F-KO	2025-09-08	BRADEN ARSENAULT, SHANE BOYD (MARMAC)	16	0	Light	None	Lots of blow down, large wood debris and vegetation stream side.
AEMP	Creek 661	661-20G-KO	2025-09-08	JOEL GUSTAVSON, BRENT HERON (MARMAC)	11	25	Calm	None	No Kokanee observed.
AEMP	Creek 661	661-20H-KO	2025-09-08	JOEL GUSTAVSON, BRENT HERON (MARMAC)	21	25	Calm	None	No Kokanee were observed during the survey
AEMP	Chedakuz Creek	CC-15B-KO	2025-09-09	BRADEN ARSENAULT, JOEL GUSTAVSON	10	0	Calm	None	No Kokanee detected. Stream sediment has lots of aquatic growth. Stream flow is slower causing algae to build up over sediment. Previously observed Redd has algae growth over the top.
AEMP	Chedakuz Creek	CC-15A-KO	2025-09-09	BRADEN ARSENAULT, JOEL GUSTAVSON	14	0	Calm	None	Cattle crossing the stream in several areas. No Kokanee detected.

Note: SC = scale, OT = otolith

Con. Index	Qualitative Characteristics (pattern clarity)	Quantitative Characteristics (repeatability)
Very Good (VG)	annuli are clear with no interpretation problems	Reader always gets the same age
Good (G)	annuli are clear with a few easy interpretation problems	Reader would get the same age most of the time for fish <10 years, within one year for fish 11-20 years
Fair (F)	annuli are fairly clear with some areas presenting easy and moderate interpretation problems	Reader would be within 1 year most of the time for fish <10 years and 2-3 years for fish >10 years
Poor (P)	annuli are fairly unclear presenting a number of difficult interpretation problems	Reader would be within 2-3 years most of the time for fish <10 years and 4-5 years for fish >10 years
Very Poor (VP)	annuli are very unclear presenting significant interpretation problems	Reader has little confidence in repeatability of age within 4-5 years

1.0 Introduction

1.1 Project Overview

The Blackwater Gold Mine (the Mine) is a gold and silver open pit mine located in central British Columbia (BC), approximately 112 kilometres (km) southwest of Vanderhoof, 160 km southwest of Prince George, and 446 km northeast of Vancouver. The Mine is located within the traditional territories of the Lhoosk'uz Dené Nation, Ulkatcho First Nation, Skin Tyee Nation, and the Tsilhqot'in Nation. The Mine's access road and transmission line cross the traditional territories of the Nadleh Whut'en First Nation, Saik'uz First Nation, Stellat'en First Nation, Nazko First Nation, Nee Tahi Buhn Band, Cheslatta Carrier Nation, and the Yekooche First Nation (BC Environmental Assessment Office [BC EAO] 2019a). The Mine footprint, located in the headwaters of the Davidson Creek and Creek 661 watersheds, includes an approximate area of 4,400 hectares, which accommodates the mine, mine waste, ore processing, and on-site infrastructure.

New Gold Inc. received a Federal Decision Statement (DS) on April 15, 2019, under the *Canadian Environmental Assessment Act*, 2012 (Canadian Environmental Assessment [CEA] Agency 2019), and an Environmental Assessment Certificate (EAC) #M19-01 on June 21, 2019, under the British Columbia 2002 *Environmental Assessment Act* (BC EAO 2019b). In August 2020, Artemis Gold Inc. (Artemis) acquired the mineral tenures, assets, and rights in the Blackwater Project, that were previously held by New Gold Inc. The EAC was transferred to Blackwater Gold Ltd. (BW Gold), a wholly owned subsidiary of Artemis on August 7, 2020, under the 2018 *Environmental Assessment Act* (BC EAO 2020). BW Gold received *Environmental Management Act* (EMA) PE-110602 on June 24, 2021, authorizing early construction works, and Permit PE-110652, authorizing discharge of effluent from the Mine to surface water and groundwater, on May 2, 2023. The Mine's construction phase was initiated in September 2022, with works continuing through 2025. Mining operations commenced on May 1, 2025, with the expected life of the Mine being 23 years.

1.2 Regulatory Requirements and Objectives

In accordance with regulatory approval requirements, long-term aquatic monitoring programs have been implemented for waterbodies in the Mine area to detect and measure changes to aquatic resources and to determine if these changes constitute mine-related effects. Condition 3.14 of the DS required BW Gold to develop a Fish and Fish Habitat Follow-Up Program (FUP) to be implemented during all phases of the Mine to verify the accuracy of the environmental assessment (EA) and to assess the efficacy of fish and fish habitat mitigation measures for Davidson Creek; the 'Follow-Up Programs for Condition 3.14 of the Blackwater Gold Decision Statement Issued under Section 54 of the Canadian Environmental Assessment Act' (Palmer Environmental Consultants Group Ltd. [Palmer] 2023a) was developed to fulfill this condition.

The 'Aquatic Effects Monitoring Program (AEMP) Plan Version 4.0' (ERM and Triton 2025) was developed to address Permit PE-110652 Condition 4.6 and Condition 30 of the EAC #M19-01. The AEMP has been designed to provide information on the aquatic receiving environment and to detect potential Mine-related effects on the AEMP components (physical, chemical, biological).

1.3 Scope of Work

This report describes the methods and results of the 2025 Kokanee (*Oncorhynchus nerka*) Fry Outmigration field program completed by Triton Environmental Consultants Ltd (Triton) between April and June 2025 to fulfill yearly monitoring requirements described in the FUP for Condition 3.14 and the AEMP Plan Version 4.0. Specifically, in relation to Condition 3.14, this field program pertained to sub-condition 3.14.2.3 – characteristics of spawner populations, whereby fry outmigration is utilized as a surrogate metric for adult Kokanee spawning success. Furthermore, this field program related to Section 4.8.3 Kokanee Fry Spring Outmigration Survey of the AEMP Plan. Kokanee fry outmigration surveys were conducted via physical fish capture using funnel nets and mark-recapture, as well as area-based estimates to evaluate efficiency.

1.4 Measurement and Assessment Endpoints

Measurement and assessment endpoints are specified in the FUP for Condition 3.14 (Palmer 2023a) and the AEMP Plan Version 4.0 (ERM and Triton 2025); endpoints relevant to the Kokanee Fry Outmigration program are provided in Table 1-1 and Table 1-2 for ease of reference.

The measurement and assessment endpoints of the Kokanee fry outmigration program are similar between the FUP for Condition 3.14 and the AEMP Plan and generally encompass total fry abundance for the outmigration period, outmigration timing, and fish health.

Table 1-1. FUP for Condition 3.14 measurement and assessment endpoints

Measurement Endpoint	*Assessment Endpoint*
Fish abundance	Calculated total fry abundance for the outmigration period
Outmigration timing	Estimated start, finish, and peak timing of outmigration movement

Table 1-2. AEMP measurement and assessment endpoints

Measurement Endpoint	*Assessment Endpoint*
Kokanee fry outmigration	Calculated total fry abundance for the outmigration period
Kokanee fry health	Condition: length and weight

2.0 Sampling Sites

Five Kokanee fry outmigration sampling sites were located on four watercourses: Davidson Creek, Creek 661, Middle Chedakuz Creek, and Lower Chedakuz Creek. Sampling site locations are presented in Table 2-1 and Figure 2-1; Descriptions of the site locations with respect to the targeted Kokanee fry population are provided below:

- The Davidson Creek site (referred to as DC-1 under the FUP for Condition 3.14 and DC-20 under the AEMP) was located immediately upstream of the confluence with Lower Chedakuz Creek, capturing fry from the entire distribution of spawning Kokanee in Davidson Creek.
- Site 661-20 was located on Creek 661 immediately upstream of its confluence with Middle Chedakuz Creek, capturing fry from the entire distribution of spawning Kokanee in Creek 661.
- The CC-02 site was located on Middle Chedakuz Creek immediately upstream of its confluence with Creek 661, capturing fry from the portion of Middle Chedakuz Creek outside of potential Mine influence.
- The CC-05 site was located at the inlet of Middle Chedakuz Creek on Tatelkuz Lake, located to capture fry from the entire distribution of spawning Kokanee in the Middle Chedakuz Creek watershed.
- The Lower Chedakuz Creek site (CC-15) was located immediately downstream of the Kluskus Forest Service Road bridge crossing, capturing fry from the portion of Lower Chedakuz Creek between the outlet of Tatelkuz Lake and the sampling location.

Representative photographs of the sampling sites are included in Appendix 1.

3.0 Methods

3.1 Sampling Timing

Fieldwork occurred over a 68-day period, from April 17 to June 26, 2025. Kokanee fry outmigration sampling followed an implementation framework in which the commencement and termination triggers were met in accordance with the established methodology described in Section 4.8.3 of the AEMP Plan, Version 4.0 (ERM and Triton 2025).

To inform sampling timing, accumulated thermal units (ATU), also known as degree-days, were calculated. ATU are a way to measure the cumulative effect of temperature on biological development, in this case, the growth and development of Kokanee eggs and fry. As fish development rates are strongly temperature-dependent, ATU provide a standardized way to estimate when key life history events (e.g., hatching, swim-up, fry emergence, migration) will occur.

Kokanee emergence has been reported to occur between approximately 900 and 950 ATU (Fisheries and Oceans Canada [DFO] 2023); however, other studies report earlier emergence, observing emergence at approximately 674 to 890 ATU (Acara 1970, Porto et al 2012, Taylor et al. 1999)

ATUs were calculated as the sum of mean daily water temperatures (°C) over time using continuously measured stream temperature data for watercourses where these data were available:

$$ATU = \sum_{i=1}^{n} T_M$$

Where:
ATU = accumulated thermal units
n = 900 to 950 ATUs
i = 1 ATU (°C/24 hours)
T_M = mean daily water temperature

Continuous water temperature data were available from long-term hydrology stations located in Davidson Creek and Lower Chedakuz Creek, and Tidbit temperate loggers located near the mouth of Creek 661 and in Middle Chedakuz Creek; The locations of these, relative to the Kokanee fry sampling locations are shown on Figure 2-1. A complete set of water temperate data was not available for Creek 661 or Middle Chedakuz due to temperature logger malfunction. Water temperature data from hydrology stations on Davidson Creek and Lower Chedakuz Creek were provided by Knight Piésold: Global Engineering and Environmental Consultants.

The calculation of ATU requires the dates of Kokanee spawning activity in the prior year (2024); Dates of Kokanee spawning activity used in the calculations are provided in Table 3-1. The start of the Kokanee spawning run was not observed in Creek 661 and Middle Chedakuz Creek due to wildfire activity in 2024; observations at Kokanee spawner sites commenced in late August (Triton 2025a). The start of Kokanee spawning activity in 2024 was, therefore, adapted from field

observations made by Triton in 2025 (Triton 2025b), with the assumption that the start dates were similar between years.

Table 3-1. Start date of Kokanee spawning activity used in ATU calculation and resulting predicted 2025 emergence date range by site

Site	*Spawning Start Date*	*Predicted Emergence Start Date Range*
DC-1/DC-20	July 30, 2024	May 7 to May 17, 2025
661-20	August 17, 2024*	N/A
CC-02	August 16, 2024*	N/A
CC-05	August 9, 2024*	May 24 to May 30, 2025
CC-15	August 13, 2024	January 27 to March 30, 2025

Note: Predicted date range provided is based on 900 and 950 ATU; N/A = Could not be predicted due to missing water temperature data; * = Direct observations were unavailable for 2024, the spawning start date was assumed based on 2025 field observations

Sampling commenced on April 17, 2025, before the earliest estimated fry emergence date for Davidson Creek and Middle Chedakuz Creek, meeting the implementation commencement trigger. Sampling did not begin before the earliest estimated fry emergence date for Lower Chedakuz Creek. Sampling frequency followed a revolving schedule; crews sampled each site once every five nights during the pre-peak period, and every second night during the peak outmigration period, unless a mark-recapture event occurred in which sampling occurred over two consecutive nights. Mark-recapture events took place once every five nights. Table 3-2 provides the site-specific sampling and recapture sampling dates.

The Kokanee fry outmigration sampling termination criteria were met at each site once the peak outmigration had been observed and an overnight sampling event resulted in few to no Kokanee fry being captured. The termination trigger based on the sampling date occurring after the latest estimated emergence date was not met because observed ATU requirements were lower than the anticipated 900 to 950 ATU, indicating that the estimate was likely too conservative. Additional sampling to meet this termination trigger would likely not have provided any meaningful information, as the Kokanee fry outmigration had already concluded.

In several instances, crews could not complete sampling on the scheduled dates. At DC-1/DC-20 on April 18, ice crystals formed on the funnel nets and traps and prevented crews from sampling effectively. At DC-1/DC-20 on April 25 and May 23 during the mark–recapture events, the Bismarck Brown Y dye failed to adhere, so crews did not recapture any marked fish on the following night. At 661-20 on May 4, crews planned a mark–recapture effort but did not catch sufficient kokanee fry to proceed. High flows on May 18 and May 19 prevented crews from sampling at 661-20; therefore, site CC-02 was sampled on May 18 instead.

Table 3-2. Kokanee fry outmigration 2025 sampling dates

Notes: **Bold** sampling dates indicate marking date with Bismarck Brown Y dye
* = dye not retained (mark-recapture event unsuccessful)

3.2 Field Methods

3.2.1 Funnel Net Traps

At each site, Kokanee fry were sampled by deploying paired fine-mesh (1.6 mm) funnel (i.e., drift) nets, according to the methods described in Fraley and Clancey (1988). The rectangular opening of each funnel net, with a cross-sectional area of 0.5 m^2 (0.94 m width by 0.53 m height), was positioned to face directly upstream. The nets were installed with the bottom of the net opening remaining flush with the stream bed. PVC tubes were connected to each funnel net with a box trap attached to the downstream end (Figure 3-1). The box traps were built with mesh screens to permit water flow and an internal V-shaped baffle to provide flow refugia for captured fry to minimize fish mortality (Figure 3-2). The funnel nets were deployed side-by-side and were installed on rebar in the thalweg of the stream.

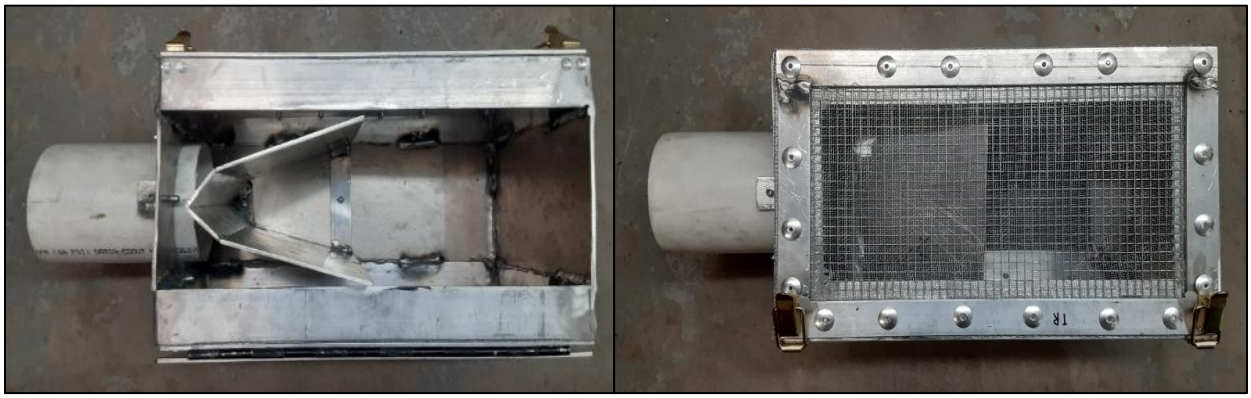
Funnel net traps were deployed overnight between the hours of 19:00 and 04:00. Within this period, the net traps were set multiple times with checks occurring approximately every 30 minutes. Set and pull times were recorded to determine effort per set. Soak times were adjusted based on environmental factors, such as the amount of impinged debris in the traps, or the number of fish caught, to minimize fish mortality.

After each set, captured fish were identified to species and life stage, and enumerated. All incidental species and a subset of the first 30 Kokanee fry per night were measured for fork length (to the nearest 1 mm) and wet-weight (to the nearest 0.01 g) and visually examined for the presence of parasites or deformities, erosion, lesions, and tumours (DELTs). Mortalities were dried with paper towel prior to weighing for increased data accuracy. Kokanee fry were also visually examined for the presence of dye marking if a mark-recapture event was ongoing at a sampling site. After processing, fish were released at the same site, downstream of the trap locations, except for fry selected for mark-recapture events (described further in Section 3.2.3).

Funnel nets, PVC pipes, and box traps were removed from the watercourses following each sampling night.

Figure 3-1. Example of funnel net, PVC tube, and box trap setup

Figure 3-2. Box trap shown open (left) and closed (right)



3.2.2 Water Quality, Discharge, and Channel Metrics

Each evening, prior to the trap installation, in situ water quality measurements, channel metrics, and discharge were recorded. In situ water quality measurements included temperature in degrees Celsius (°C), pH, specific conductivity in microsiemens per centimetre (µS/cm), and dissolved oxygen in milligrams per litre (mg/L) and percent (%) saturation and were collected using a YSI ProQuatro multiparameter meter.

Measurements of channel (bankfull) width (m), channel wetted width (m), and water depth (m) were collected at each site. Discharge in cubic metres per second (m^3/s) was measured using a

Swoffer Model 2100 Current Velocity Meter to measure water velocity and a ruler for depth. Discharge transects were divided into 20 intervals where width, depth, and velocity were measured.

3.2.3 Mark-Recapture and Mortality Test

Mark-recapture and mortality test were conducted at all sites and were based on a rotating schedule of once every five nights. When Kokanee fry were captured during a scheduled sampling night, a consecutive two-night mark-recapture event was conducted to determine capture efficiency of the nets and derive population estimates (Carlson et al. 1988). On the first night, Kokanee fry were marked with Bismarck Brown Y dye at a 1:15,000 concentration by mixing 1.0 g dye powder with 15 litres of water. The dye solution was filtered through cheese cloth to remove dye residue. Fry were immersed for up to 90 minutes in an aerated dye bucket, then held in an aerated recovery bucket for a 60-minute period. Marked fish (Figure 3-3) were held overnight in an instream live car. The following day the marked fish were released approximately 500 m upstream from the sampling site for recapture on the second sampling night.

To test if the survival of fry is affected by the Bismarck Brown Y dye, mortality tests were conducted during mark recapture events. A subset of marked and unmarked fry (maximum of 20 each) were placed in separate mesh bags and held overnight in the live car. The mesh bags were checked the following day and the number of mortalities versus live fish was recorded. The subset of marked fish was released with the remaining marked fish upstream to be recaptured the following night. The unmarked fish were released at the sampling location to ensure they were not recounted.

Figure 3-3 Kokanee fry marked with Bismarck Brown Y dye

3.3 Quality Assurance/Quality Control

Water quality meters were calibrated each morning prior to use. Calibration solutions for conductivity (1,413 µS/cm) and pH (4.01, 7.01, and 10.01 pH) were used to calibrate the YSI

ProQuatro multiparameter meters. The dissolved oxygen (DO) sensor was calibrated in the field prior to use; sensor membranes and fluid were replaced when required.

Field data, photographs, and mapping information collected on digital platforms were examined for completeness prior to being uploaded nightly to cloud servers. This procedure was used to ensure data integrity and to mitigate the risk of data loss.

Field crews were experienced with, and knowledgeable of, the fish species present in the local watersheds. A subset of captured fish was photographed for species identification verification.

The mesh on the funnel nets and traps was inspected for damage prior to installation and at the start of each set and repaired when required.

3.4 Data Analysis

3.4.1 Fry Abundance

Kokanee fry abundance was calculated using nightly out-migrating fry estimations. Two sets of estimates were calculated:

1. Trapping Efficiency Catch Expansion, using trap efficiency, estimated by the sub-sampling mark-recapture approach; and
2. Area-based Catch Expansion, comparing the wetted cross-sectional area of the stream at the sampling location to the wetted cross-sectional area of the net opening.

3.4.1.1 Trap Efficiency Catch Expansion

Trap efficiency measures how well a trap captures fish that pass through the site (i.e., the proportion of fish that migrate past the site that are actually caught). It is estimated by the ratio of recaptured, marked fish to the total number of marked fish. However, this simple ratio can be biased, especially with small sample sizes. The Chapman-corrected trap efficiency (Chapman 1951; Ricker 1975) adjusts the estimate to reduce bias:

$$p_c = \frac{m+1}{M+1}$$

Where:
M = number of marked fish released during night one
m = the number of marked fish captured during night two
p_c = Chapman-corrected trap efficiency

Abundance at each sampling visit i was estimated using the Horvitz-Thompson estimator by dividing the catch at each sampling visit i by the site-specific Chapman-corrected trap efficiency, p_c, thereby expanding the sample to account for fish that passed the site but were not captured. Confidence intervals (95%) were also calculated for each abundance estimate.

$$A_i = \frac{c_i}{p_c}$$

$$Var(A_i) = {A_i}^2 * \frac{1 - p_c}{p_c * M}$$

$$CI_{95}(A_i) = \pm 1.96 * Var(A_i)$$

Where:
A_i = estimated abundance at site visit i
c_i = catch of both marked and unmarked fish at site visit i
p_c = Chapman-corrected trap efficiency
M = number of marked fish released
$Var(A_i)$ = the variance of the estimated abundance A at site visit i
$CI_{95}(A_i)$ = the 95% confidence intervals of the estimated abundance A at site visit i

3.4.1.2 Area-Based Catch Expansion

The area-based estimate expands the catch based on the wetted cross-sectional area of the net opening to the wetted cross-sectional area of the stream at the sampling location. The estimate per set is then further expanded for the period that was not fished. The total nightly catch was then calculated as the sum of all time interval fry abundance estimates. The following equation was used to calculate a fry abundance estimate for each set (adapted from Manson 2005):

$$n = C * \left(\frac{A}{a}\right) * \left(\frac{T}{t}\right)$$

Where:
n = fry abundance estimate for each set
C = total catch of set
A = cross-sectional channel area
a = wetted net area
T = time from start of current set to start of subsequent set
t = set time

Migration outside of the sampling period was assumed to be zero, based on literature (Manson 2005) and results of daytime sampling completed by Palmer (2023b).

3.4.1.3 Total Fry Abundance

Estimates of Kokanee fry outmigration abundance were calculated using the trapezoidal area-under-the-curve (TAUC) method. This involved calculating the area under the plotted curve of abundance versus sampling date using trapezoidal integration. The area under this curve gives the estimated total number of fish-days, calculated as:

$$\widehat{N} = \sum_{i=1}^{n-1} \frac{(A_i + A_{i+1})}{2}(t_{i+1} - t_i)$$

Where:
$\widehat{N}$ = estimated total fish-days
n = the total number of site visits
A_i = estimated abundance at site visit i
t_i = the day of year at site visit i

The TAUC estimate of total fry abundance is then obtained by dividing $\widehat{N}$ by a value of survey life (SL; synonymous with residence time or stream life). For the purposes of this study, it is assumed that Kokanee fry do not migrate back upstream; therefore, SL was set to 1.

Confidence intervals for TAUC abundance estimates were generated in an equivalent fashion using the TAUC method with the upper and lower confidence intervals from each site visit.

3.4.2 Outmigration Timing

Predicted Kokanee fry outmigration timing was determined via the calculation of ATUs, based on the 2024 Kokanee spawning season, following the same methodology described in Section 3.1. The timing of the earliest, peak, and latest Kokanee spawners observed during the 2024 season used in the ATU calculations are provided in Table 3-3. Similarly to the dates used in Section 3.1, a number of these were not observed in 2024 due to a wildfire reduced field season; therefore, the dates of start, peak, and end of spawning observed in 2025 were used. The start, finish, and peak timing of Kokanee fry outmigration movement at each site was estimated based on direct field observations.

Table 3-3. Start, peak, and end of Kokanee spawning activity used to determine predicted fry outmigration dates

Site	*Start*	*Peak*	*End*
DC-1/DC-20	July 30, 2024	August 11, 2024	September 26, 2024
661-20	August 17, 2024*	August 31, 2024*	September 8, 2025
CC-02	August 16, 2024*	August 23, 2024*	September 21, 2024
CC-05	August 9, 2024*	August 23, 2024*	September 25, 2024
CC-15	August 13, 2024	September 3, 2024	September 23, 2024

Note: * = Direct observations were unavailable for 2024, the spawning start date was assumed based on 2025 field observations

3.4.3 Fish Health – Condition

Condition indices provide a comparative measure of the plumpness of fish. Fulton's condition factor (*K*) was calculated based on the weight (g) of the fish (*W*) and fork length (mm) of the fish (*L*) as follows:

$$K = 100{,}000\ x\ \frac{W}{L^3}$$

Fulton's conditions were statistically compared among sites. First, the distributions were tested for normality using an Anderson-Darling test. If data were normally distributed, a single factor Analysis of Variance (ANOVA), followed by a Tukey's multiple comparison test, was computed to compare Fulton's condition among sites. If the data were not normally distributed, a Kruskal-Wallis test by ranks was used with a Steel-Dwass test for multiple comparisons. The significance threshold was set at $p < 0.05$.

3.4.4 Egg to Fry Survival

Egg to fry survival estimates were calculated for the surveyed watercourses where data were available. Potential egg deposition during the spawning year (2024) and the resulting fry escapement (i.e., abundance) estimates from 2025 were required to estimate egg to fry survival. Egg to fry survival is expressed as a percentage of estimated escapement to estimated potential egg deposition. As two estimates of escapement were calculated for 2025, using an area-based method and mark-recapture method, each were used to provide estimates of egg to fry survival.

The potential egg deposition (PED_t) provides an estimate of the total number of eggs that could be deposited during the spawning year (2024), and it was calculated as follows (Plate et al 2018):

$$\boldsymbol{PED_t = N_f \times PED_f}$$

Where:
PED_t = Potential total eggs deposited
N_f = Number of females
PED_f = Potential eggs deposited per female

The number of females in the spawning population (N_f) was derived as follows:

$$\boldsymbol{N_f = \frac{F_s}{T_s} \times P_a}$$

Where:
F_s = number of females sampled
T_s = total number of fish sampled
P_a = Population abundance (total abundance estimate)

The F_s / T_s term is simply the proportion of females in the population. It was derived using observed sex ratios from the 2024 spawning year (Triton 2025a). If sex ratio data were unavailable, the proportion of females was assumed to be 50%.

The potential eggs deposited per female (PED_f) was calculated as follows:

$$PED_f = f - r$$

Where:
f= mean fecundity
r = mean egg retention

As egg retention and fecundity require extensive invasive sampling resulting in excessive mortalities, and are outside the scope of this program, mean egg retention and fecundity values were estimated. The mean egg retention value was adapted from Bassett and Baxter (2023). Studies of adult Kokanee populations have shown a positive relationship between fecundity and fork length, indicating that reproductive potential increases with female body size (Elgar 1990, McGurk 2000, Wilson and Shrimpton 2021). To account for this relationship, estimated fecundity was calculated as follows (Sebastian et al. 2003):

$$Log_{10} f = 2.2955(Log_{10}\, FL) - 3.0068$$

Where:
f = mean fecundity (number of eggs per female)
FL = mean fork length in mm from the 2024 spawning year

3.4.5 Mortality Test

A total of 32 Bismarck Brown Y dye mortality tests were conducted across all sites. Mean mortality for marked and unmarked fry was calculated. Mortality of marked and unmarked fry was compared to determine whether mortality rates differed significantly between groups using a binomial generalized linear mixed-effects model, with sample included as a random intercept.

4.0 Results

4.1 Fish Capture, Mortalities and Effort

The 2025 Kokanee Fry Outmigration program captured a total of 59,943 Kokanee fry across all sites. Incidental bycatch, across all sites, included two Lake Chub (*Couesius plumbeus*), 28 Largescale Suckers (*Catostomus macrocheilus*), 51 Longnose Dace (*Rhinichthys cataractae*), 17 Longnose Sucker (*Catostomus catostomus*), three Mountain Whitefish (*Prosopium williamsoni*), 334 Northern Pikeminnow (*Ptychocheilus oregonensis*), 198 Prickly Sculpin (*Cottus asper*), 105 Rainbow Trout (*Oncorhynchus mykiss*), 106 other sculpin (*Cottus* spp.), seven sucker (*Catastomus* spp.), and 1509 unidentified fish. Table 4-1 presents the total funnel net sampling effort and total number of fish captured at each site.

Table 4-1. Total effort and number of fish captured per site

Site	*Total Effort (hours)*	*Total number of fish captured*	*Number of Kokanee Captured*	*Number of incidental bycatch*
DC-1/ DC-20	236.01	22,987	22,890	97
661-20	190.77	4,503	4,477	26
CC-02	179.99	17,654	17,403	242
CC-05	164.34	12,181	11,765	416
CC-15	266.95	4,987	3,408	1,579

A total of 729 Kokanee fry mortalities were recorded during funnel net sampling and Bismarck Brown Y Dye marking events. Funnel net sampling accounted for 396 mortalities, while marking events and mortalities studies accounted for 333 mortalities. Table 4-2 presents the number of Kokanee mortalities by site and cause during the use of funnel-nets. Impingement during funnel-net sampling also caused one Prickly Sculpin mortality at CC-02. Predation in the trap during funnel-net sampling caused a mortality of an unidentified species at DC-1/DC-20.

Across all sites, 54 Kokanee fry mortalities occurred during the marking process, and 233 marked fry mortalities were observed in the live cars (Table 4-2). During the mortality studies, 18 mortalities occurred among unmarked Kokanee fry and 27 mortalities among marked fry. For each mortality test, the percent marked and unmarked mortality were recorded. Mean mortality (N=32) was 3.04% for unmarked fry and 5.31% for marked fry. The standard deviation was 5.40% for unmarked fry and 8.42% for marked fry. Mortality did not differ significantly between unmarked and marked fry (p = 0.12)

Table 4-2. Number of Kokanee fry mortalities by site and cause during funnel-net sampling

Site	Number of Mortalities by Cause						Total Mortalities	% Mortality
	Capture Trauma	Handling Trauma	Impinged	Previously deceased	Predation	Unknown		
DC-1/DC-20	61	27	11	1	9	1	110	0.48
661-20	27	4	7	2	2	3	45	1.00
CC-02	124	23	7	1	-	-	155	0.89

CC-15	1,037	47	0	29	1	5	35	3.23

4.2 Fry Abundance

The TAUC estimates of total fry outmigration abundance for each site, including standard error and the 95% confidence intervals, are provided in Table 4-4. At all sites, the abundance estimates based on mark-recapture were greater than the area-based estimates. Due to larger variability with mark-recapture estimates, the confidence limits were wider compared to those for the area-based abundance estimates. Abundance estimates derived from mark-recapture may be biased due to violations of the assumptions required for open-population mark-recapture models. During several mark-recapture events, poor dye retention made marked fish difficult to detect, potentially reducing the recorded recapture count and resulting in an overestimation of abundance. In contrast, area-based estimates may underestimate Kokanee fry abundance as it assumes that fish density is uniform across the width and depth of the sampling site; concentrated groups of fish may be missed, especially at sites where the paired funnel nets only sample a small proportion of the overall cross-sectional area of the watercourse.

Table 4-4. TAUC Kokanee fry abundance estimates

Site	*Mark-Recapture Abundance*				*Area-Based Abundance*			
	Estimate	*SE*	*LCL*	*UCL*	*Estimate*	*SE*	*LCL*	*UCL*
DC-1/DC-20	216,209	982	204,641	228,430	137,107	933	135,278	138,936
661-20	51,132	726	44,663	58,539	13,799	214	13,379	14,220
CC-02	176,333	1744	164,308	189,239	82,220	664	80,918	83,523

CC-15	111,587	2435	88,940	140,001	63,010	1,117	60,821	65,200

Note: SE = Standard error, LCL = Lower 95% confidence limit, UCL = Upper 95% confidence limit

In Davidson Creek, both abundance estimation methods for Kokanee fry outmigration showed multiple pulsed peaks across the sampling period. Kokanee fry outmigration abundance estimates increased during a short-duration discharge pulse on May 20, 2025. Peak outmigration abundance occurred late May as the discharge was decreasing (Figure 4-1). The timing of peak outmigration abundance in 2025 was the same as in 2024.

In Creek 661, both abundance estimation methods for Kokanee fry outmigration showed multiple pulsed peaks across the sampling period. Kokanee fry outmigration abundance estimates were generally low during periods of peak discharge, followed by multiple pulsed increases in outmigration abundance after discharge reached a peak and subsequently decreased (Figure 4-2). Peak outmigration occurred during the same period in 2024.

In Middle Chedakuz Creek (CC-02), both abundance estimation methods for Kokanee fry outmigration showed one single peak in mid May. This was about a week earlier than that seen in 2024. Discharge data were missing during the outmigration peak; however, peak outmigration occurred before the peak discharge (Figure 4-3).

In Middle Chedakuz Creek (CC-05), both abundance estimation methods for Kokanee fry outmigration showed one distinct peak in mid May. As with site CC-02, peak outmigration

occurred before the peak discharge. At peak discharge, abundance estimates exhibited a small secondary peak (Figure 4-4). The outmigration pattern in 2025 was different than that observed in 2024, which showed similar levels of outmigration over a two-week period in late May.

In Lower Chedakuz Creek (CC-15), both abundance estimation methods for Kokanee fry outmigration showed several pulsed peaks across the sampling period. There was no apparent relationship between flow rate and outmigration activity. The period of peak outmigration (with two peaks in abundance in late May and early June) occurred as the discharge was declining (Figure 4-5). Peak migration occurred a few days later in 2025 compared to 2024.

Note: Mean daily discharge data from the CC-15 hydrometric station provided by Knight Piésold

4.3 Outmigration Timing

Based on the accumulation of 900 to 950 ATU, the predicted start, peak, and end of fry outmigration activity at each site are provided in Table 4-5. The observed dates are also provided. The ATU from the start, peak, and end of the 2024 Kokanee spawning season along with the corresponding water temperature for Davidson Creek, Middle Chedakuz Creek and Lower Chedakuz Creek are presented in Figure 4-6, Figure 4-7, and Figure 4-8, respectively.

Table 4-5. Predicted and observed start, peak, and end dates of Kokanee fry outmigration in 2025 for each sampling site

Site	*Start*		*Peak*		*End*	
	Predicted	***Observed***	***Predicted***	***Observed***	***Predicted***	***Observed***
DC-1/DC-20	May 7 to 17	Prior to April 18	June 4 to 9	May 29	July 19 to 23	June 12
661-20	N/A	Prior to April 19	N/A	May 29	N/A	June 11
CC-02	N/A	Prior to April 20	N/A	May 12	N/A	June 13
CC-05	May 24 to 30	Prior to May 1	June 12 to 16	May 15	July 11 to 15	June 19
CC-15	January 1 to March 30	Prior to April 17	May 26 to 31	June 4	June 18 to 22	June 26

Note: Predicted date range provided is based on 900 and 950 ATUs; N/A = Could not be predicted due to missing water temperature data

In Davidson Creek, observed Kokanee fry outmigration occurred earlier than predicted, starting in mid April, with a peak observed on May 29, 2025, and ending in mid June. Based on the observed dates, emergence began at approximately 857 ATU, with peak outmigration occurring at approximately 861 ATU. It is important to note that the DC-05 hydrology station in Davidson Creek is located more than 10km upstream of the lower reaches where Kokanee spawning occurs. The recorded water temperatures, and resulting ATU values, may not be representative of the specific conditions experienced by Kokanee embryos during development.

In Creek 661, the observed Kokanee fry outmigration began in mid April, with a peak observed on May 29, 2025, and ending in mid June. No comparison could be made between predicted and observed outmigration dates in Creek 661 because water temperature data were unavailable from March 11 to April 17, 2025, and again from June 13, 2025, onward due to a temperate logger malfunction; consequently, the predicted start, peak and end could not be calculated based on ATU. The observed ATU requirements for developing Kokanee embryos in Creek 661 could also not be determined.

In Middle Chedakuz Creek (CC-02), the observed Kokanee fry outmigration began in mid April, with a peak observed on May 12 ,2025, and ending in mid June. No comparison could be made between predicted and observed outmigration dates at CC-02 because water temperature data were unavailable from April 5 to June 1, 2025, due to a temperate logger malfunction;

consequently, the start and peak could not be calculated based on ATU. The observed ATU requirements for developing Kokanee embryos at CC-02 also could not be determined.

In Middle Chedakuz Creek (CC-05), the observed Kokanee fry outmigration began in early May, with a peak observed on May 15, 2025, and ending in mid June. Based on the observed dates, emergence began at approximately 778 ATU, with peak outmigration occurring at approximately 666 ATU. The ATU observed at peak outmigration was notably lower than other reported values.

The observed outmigration in Lower Chedakuz Creek (site CC-15) occurred later than the predicted dates, starting prior to mid April, with a peak observed on June 4, 2025, and ending in late June. Based on these observed dates, Kokanee fry emergence began at approximately 977 ATU, with peak migration occurring at 990 ATU.

In 2025, Kokanee fry outmigration was observed to start below the referenced 900 to 950 ATU threshold across all sites except in Lower Chedakuz Creek. Kokanee fry emergence ranged from approximately 778 ATU to 977 ATU. To better inform future sampling and improve estimates of outmigration timing, a lower ATU threshold should be considered when estimating emergence dates.

Figure 4-6. Accumulated thermal units (ATU) from the start, peak, and end of the 2024 Kokanee spawning season along with the corresponding water temperature in Davidson Creek at site DC-1/DC-20

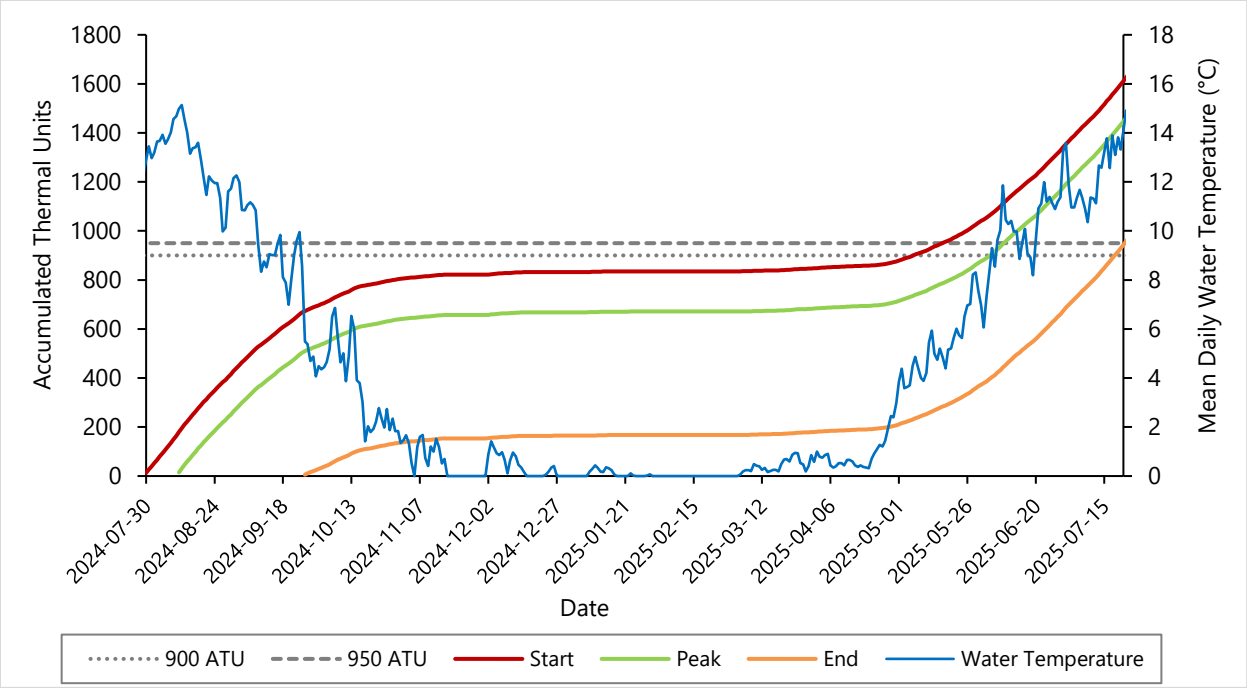

Figure 4-7. Accumulated thermal units from the start, peak, and end of the 2024 Kokanee spawning season along with the corresponding water temperature in Middle Chedakuz Creek at site CC-05

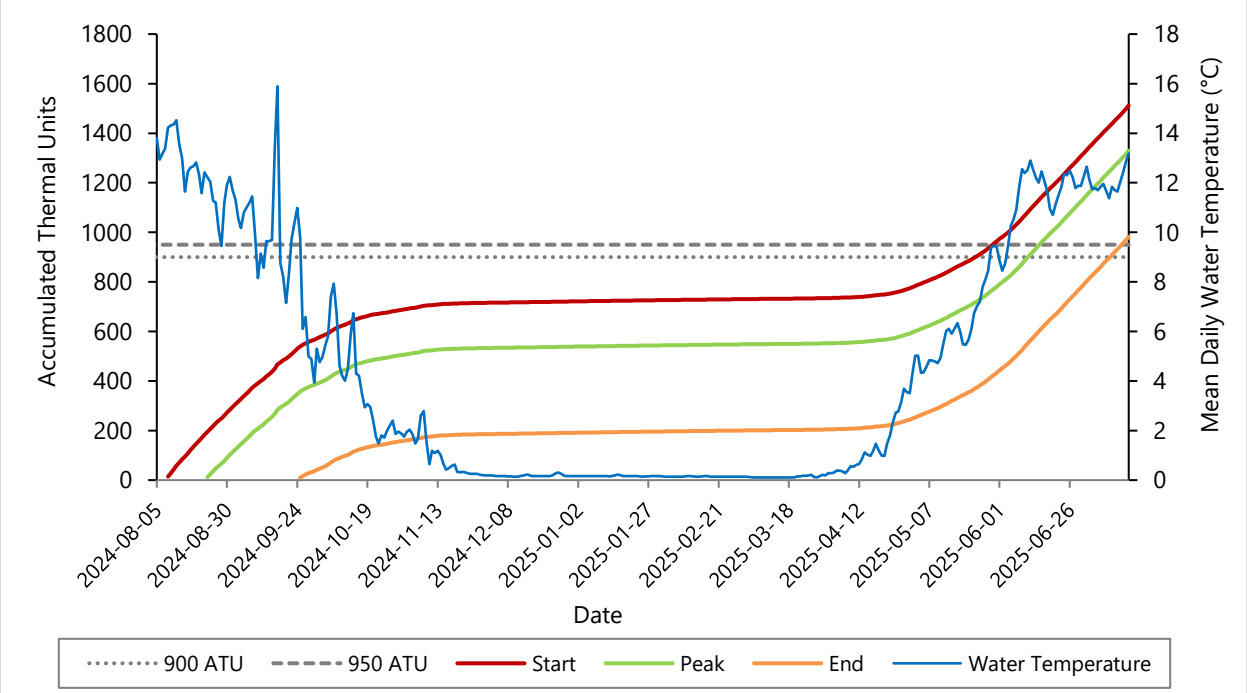

Figure 4-8. Accumulated thermal units from the start, peak, and end of the 2024 Kokanee spawning season along with the corresponding water temperature in Lower Chedakuz Creek at site CC-15

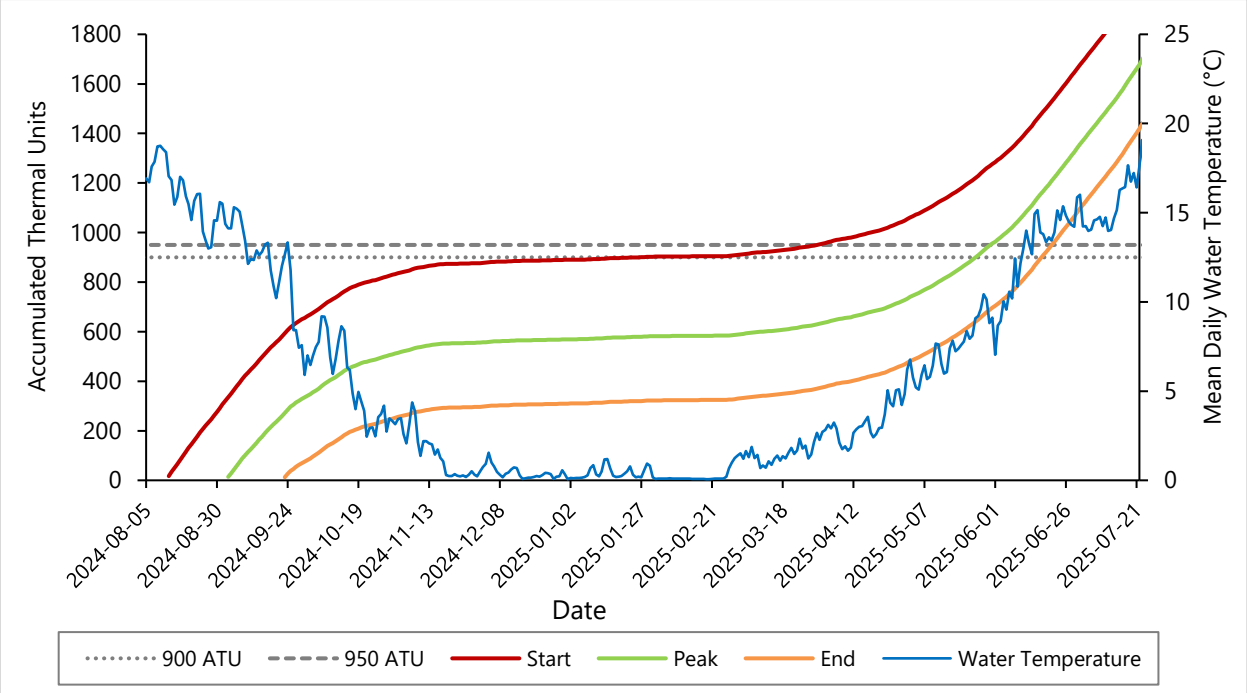


4.4 Fish Health – Condition

Fulton's condition of Kokanee fry were compared among sampling sites following the methods described in section 3.4.3. Mean Fulton's condition (with 95% confidence intervals) is displayed in Figure 4-9. Individual fish measurements, including Fulton's condition, are provided in Appendix 2.

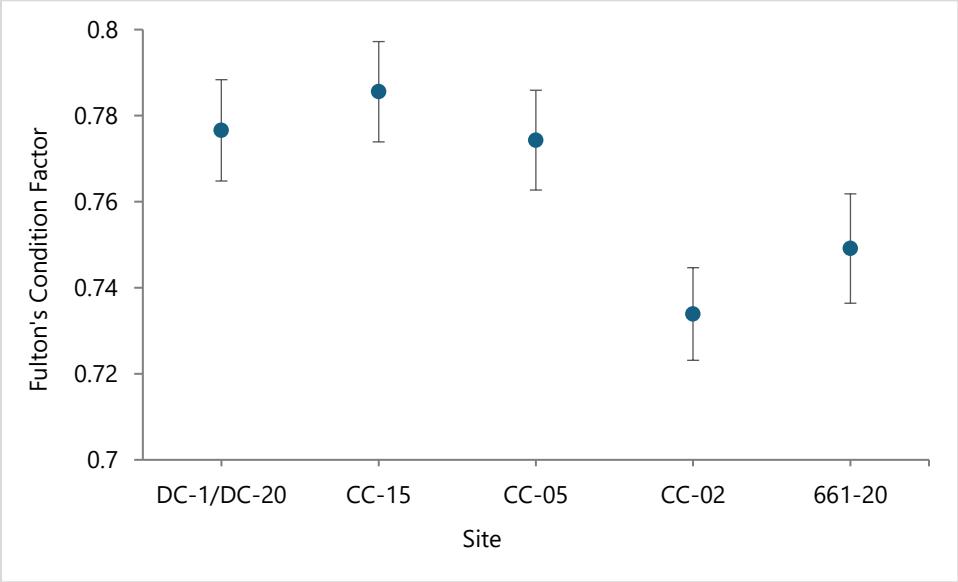
The data from all sites were found to be non-normally distributed; therefore, a Kruskal-Wallis test followed by a Steel-Dwass test was computed to compare Fulton's condition among sampling sites. A significant difference in Fulton's condition was found among sampling sites ($p < 0.001$).

The greatest condition factors were observed at sites DC-1/DC-20, CC-15 and CC-05 (Figure 4-9), and these were all significantly greater ($p < 0.001$) than the condition factors at CC-02 and 661-20 (Table 4-6).

Table 4-6. Steel-Dwass multiple comparison - Fulton's Condition p-values for Kokanee Fry. Significant values are bolded (p < 0.05).

Site	661-20	CC-02	CC-05	CC-15
CC-02	0.869549			
CC-05	**0.000108**	**$3.85e^{-7}$**		
CC-15	**$2.7e^{-7}$**	**$1.37e^{-10}$**	0.707513	
DC-1/DC-20	**0.000174**	**$4.83e^{-7}$**	0.999645	0.587368

Figure 4-9. Mean (with 95% confidence intervals) Fulton's condition of Kokanee fry according to sampling site



4.5 Egg to Fry Survival

Egg to fry survival estimates were not calculated for Creek 661, Middle Chedakuz Creek, or Lower Chedakuz Creek due to the absence of Kokanee spawner abundance estimates in 2024. Consequently, fecundity and egg to fry survival were only estimated for Davidson Creek.

Fecundity estimates were determined following the methods described in section 3.4.4. During the 2024 Kokanee Spawner Program, females comprised 40.7% of the sampled population, and the mean fork length of adult female Kokanee was 229 mm, corresponding to an estimated fecundity of 250 eggs per female. The egg retention value, derived from Bassett (2023), reported a five-year average of seven retained eggs per female. The potential total eggs deposited during the 2024 Kokanee spawning season in Davidson Creek was 908,492.

The estimated egg to fry survival for the 2025 Kokanee fry brood in Davidson Creek was 23.80% using Kokanee fry abundance estimates based on mark-recapture, and 15.09% based on the area-based method. It should be noted that egg to fry survival estimates may not be reliable due to a small sample size for sex ratio information and the absence of fecundity and egg retention values specific to the sampled watercourses. Actual fecundity and egg retention values were unavailable for these watercourses, resulting in uncertainty around egg to fry survival estimates.

5.0 Closing

The 2025 Kokanee Fry Outmigration program was successful in collecting and evaluating data relating to the long-term monitoring requirements under the FUP for Condition 3.14 and the AEMP. This 2025 report was compiled using data collected from April to June 2025, over a 68-day period, to characterize the Kokanee fry populations within Davidson Creek, Creek 661, and Chedakuz Creek. Fieldwork included Kokanee fry capture using funnel net traps, mark-recapture, water quality and discharge measurements, and fish processing. The 2025 monitoring results will contribute to evaluating Davidson Creek, Creek 661 and Chedakuz Creek with respect to mitigation effectiveness and to detect Mine-related effects under the FUP for Condition 3.14 and the AEMP.

AEMP	Chedakuz Creek	CC-02	2025-05-27	22	CHRIS FLUIT, FERGUSSON BURCHELL, JARED BREITKREUZ	11.6	25	Light	None	
AEMP	Creek 661	661-20	2025-05-27	21	DAVID MARTIN, RANDALL HENNIGAR (BWG), MELISSA MUIRHEAD	14	50	Calm	Intermittent Rain Shower	Approximately at 2300 hrs, the flow, debris load and turbidity increased.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-26	24	ROBIN GRÉGOIRE, BRADEN ARSENAULT, MATTHEW CARTER	8	100	Calm	None	
AEMP	Chedakuz Creek	CC-05	2025-05-27	17	ROBIN GRÉGOIRE, BRADEN ARSENAULT, MATTHEW CARTER	12	75	Calm	None	Water level is quite high. Stream has topped the gravel bar separating from main lake. Toads are active and swimming near site.
AEMP	Chedakuz Creek	CC-15	2025-05-28	23	CHRIS FLUIT, FERGUSSON BURCHELL, MELISSA MUIRHEAD	18	75	Light	None	
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-28	25	DAVID MARTIN, RANDALL HENNIGAR (BWG), MATTHEW CARTER	15	25	Light	None	
AEMP	Chedakuz Creek	CC-05	2025-05-28	18	ROBIN GRÉGOIRE, JARED BREITKREUZ, BRADEN ARSENAULT	18	75	Calm	None	Water level has receded since previous night. Large amount of pike minnow activity at mouth of creek. Lots of toads in area
AEMP	Chedakuz Creek	CC-02	2025-05-29	23	CHRIS FLUIT, FERGUSSON BURCHELL, MELISSA MUIRHEAD	8.6	0	Light	None	

Table A2-2. Survey Information

Program	Waterbody	Site	Survey Date	Site Visit #	Crew Names	Air Temperature (°C)	Cloud Cover (%)	Wind	Precipitation	Comments
AEMP	Creek 661	661-20	2025-05-29	22	ROBIN GRÉGOIRE, JARED BREITKRUEZ, BRADEN ARSENAULT	15	0	Calm	None	Water level noticeably lower. Net for trap 1 required repair before start. Large amounts of small woody debris (burnt needles) and small benthic organisms present.
Condition 3.14 / AEMP	Davidson Creek	DC-1/DC-20	2025-05-29	26	DAVID MARTIN, RANDALL HENNIGAR (BWG), MATTHEW CARTER	14	25	Light	None	
AEMP	Chedakuz Creek	CC-02	2025-05-30	24	DAVID MARTIN, RANDALL HENNIGAR (BWG), MATTHEW CARTER	13	100	Calm	None	
AEMP	Chedakuz Creek	CC-15	2025-05-30	24	CHRIS FLUIT, FERGUSSON BURCHELL, MELISSA MUIRHEAD	9.6	100	Light	None	
AEMP	Chedakuz Creek	CC-05	2025-05-30	19	ROBIN GRÉGOIRE, JARED BREITKREUZ, BRADEN ARSENAULT	10	75	Light	None	Scale stopped working part way into the night. Lot of sculpins present in the traps. All appear to be eating fry.
AEMP	Creek 661	661-20	2025-05-31	23	ROBIN GRÉGOIRE, JARED BREITKREUZ, BRADEN ARSENAULT	12	50	Light	None	Water level noticeably lower than previous visits. Several large rainbow trout resting in front of nets.
AEMP	Chedakuz Creek	CC-15	2025-05-31	25	CHRIS FLUIT, FERGUSSON BURCHELL, MELISSA MUIRHEAD	9.2	50	Moderate	None
